15 Internet Printing Protocol/1.1: Model and Semantics

16 Copyright (C) The Internet Society (1999). All Rights Reserved.

17 Status of this Memo

18 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of
19 [RFC2026]. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its
20 areas, and its working groups. Note that other groups may also distribute working documents as Internet-
21 Drafts.

22 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or
23 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or
24 to cite them other than as "work in progress".

25 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

26 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>. Abstract

27 This document is one of a set of documents, which together describe all aspects of a new Internet Printing
28 Protocol (IPP). IPP is an application level protocol that can be used for distributed printing using Internet
29 tools and technologies. This document describes a simplified model consisting of abstract objects, their
30 attributes, and their operations that is independent of encoding and transport. The model consists of a
31 Printer and a Job object. A Job optionally supports multiple documents. IPP 1.1 semantics allow end-users
32 and operators to query printer capabilities, submit print jobs, inquire about the status of print jobs and
33 printers, cancel, hold, release, and restart print jobs. IPP 1.1 semantics allow operators to pause, resume,
34 and purge (jobs from) Printer objects. This document also addresses security, internationalization, and
35 directory issues.

36 The full set of IPP documents includes:

- 37 Design Goals for an Internet Printing Protocol [RFC2567]
- 38 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]
- 39 Internet Printing Protocol/1.1: Model and Semantics (this document)
- 40 Internet Printing Protocol/1.1: Encoding and Transport [IPP-PRO]

41 Internet Printing Protocol/1.1: Implementer's Guide [IPP-IIG]
42 Mapping between LPD and IPP Protocols [RFC2569]

43

44 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed printing
45 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included
46 in a printing protocol for the Internet. It identifies requirements for three types of users: end users,
47 operators, and administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0.
48 Operator and administrator requirements are out of scope for version 1.0. A few OPTIONAL operator
49 operations have been added to IPP/1.1.

50 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document
51 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of
52 IPP specification documents, and gives background and rationale for the IETF working group's major
53 decisions.

54 The "Internet Printing Protocol/1.1: Encoding and Transport" document is a formal mapping of the abstract
55 operations and attributes defined in the model document onto HTTP/1.1. It defines the encoding rules for a
56 new Internet MIME media type called "application/ipp". This document also defines the rules for
57 transporting over HTTP a message body whose Content-Type is "application/ipp". This document defines a
58 new scheme named 'ipp' for identifying IPP printers and jobs. Finally, this document defines
59 interoperability rules for supporting IPP/1.0 clients. **Issue 33**

60 The "Internet Printing Protocol/1.1: Implementer's Guide" document gives insight and advice to
61 implementers of IPP clients and IPP objects. It is intended to help them understand IPP/1.1 and some of the
62 considerations that may assist them in the design of their client and/or IPP object implementations. For
63 example, a typical order of processing requests is given, including error checking. Motivation for some of
64 the specification decisions is also included.

65 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of gateways
66 between IPP and LPD (Line Printer Daemon) implementations.

Table of Contents

67		
68	1. Introduction.....	10
69	1.1 Simplified Printing Model	11
70	2. IPP Objects.....	13
71	2.1 Printer Object	13
72	2.2 Job Object	15
73	2.3 Object Relationships	16
74	2.4 Object Identity.....	17
75	3. IPP Operations	19
76	3.1 Common Semantics	20
77	3.1.1 Required Parameters	20
78	3.1.2 Operation IDs and Request IDs	21
79	3.1.3 Attributes	21
80	3.1.4 Character Set and Natural Language Operation Attributes.....	22
81	3.1.4.1 Request Operation Attributes.....	23
82	3.1.4.2 Response Operation Attributes	25
83	3.1.5 Operation Targets.....	26
84	3.1.6 Operation Response Status Codes and Status Messages	28
85	3.1.6.1 "status-code" (type2 enum)	28
86	3.1.6.2 "status-message" (text(255))	28
87	3.1.6.3 "detailed-status-message" (text(MAX)) Issue 35	29
88	3.1.6.4 "document-access-error" (text(MAX)) Issue 35	29
89	3.1.7 Unsupported Attributes	29
90	3.1.8 Versions	31
91	3.1.9 Job Creation Operations.....	32
92	3.2 Printer Operations	34
93	3.2.1 Print-Job Operation.....	34
94	3.2.1.1 Print-Job Request.....	35
95	3.2.1.2 Print-Job Response.....	38
96	3.2.2 Print-URI Operation.....	40
97	3.2.3 Validate-Job Operation	41
98	3.2.4 Create-Job Operation	41
99	3.2.5 Get-Printer-Attributes Operation	42
100	3.2.5.1 Get-Printer-Attributes Request	42
101	3.2.5.2 Get-Printer-Attributes Response	44
102	3.2.6 Get-Jobs Operation	45
103	3.2.6.1 Get-Jobs Request.....	45
104	3.2.6.2 Get-Jobs Response	46
105	3.2.7 Pause-Printer Operation.....	47
106	3.2.7.1 Pause-Printer Request	49
107	3.2.7.2 Pause-Printer Response.....	49
108	3.2.8 Resume-Printer Operation	49

109	3.2.9	Purge-Jobs Operation.....	50
110	3.3	Job Operations.....	51
111	3.3.1	Send-Document Operation.....	51
112	3.3.1.1	Send-Document Request.....	52
113	3.3.1.2	Send-Document Response	53
114	3.3.2	Send-URI Operation	54
115	3.3.3	Cancel-Job Operation	54
116	3.3.3.1	Cancel-Job Request.....	55
117	3.3.3.2	Cancel-Job Response	55
118	3.3.4	Get-Job-Attributes Operation	56
119	3.3.4.1	Get-Job-Attributes Request.....	56
120	3.3.4.2	Get-Job-Attributes Response	57
121	3.3.5	Hold-Job Operation.....	58
122	3.3.5.1	Hold-Job Request.....	59
123	3.3.5.2	Hold-Job Response	59
124	3.3.6	Release-Job Operation	59
125	3.3.7	Restart-Job Operation	60
126	3.3.7.1	Restart-Job Request.....	61
127	3.3.7.2	Restart-Job Response	62
128	4.	Object Attributes.....	62
129	4.1	Attribute Syntaxes.....	63
130	4.1.1	'text'.....	63
131	4.1.1.1	'textWithoutLanguage'.....	64
132	4.1.1.2	'textWithLanguage'.....	64
133	4.1.2	'name'.....	65
134	4.1.2.1	'nameWithoutLanguage'.....	65
135	4.1.2.2	'nameWithLanguage'.....	65
136	4.1.2.3	Matching 'name' attribute values.....	66
137	4.1.3	'keyword'.....	66
138	4.1.4	'enum'.....	67

345 1. Introduction

346 The Internet Printing Protocol (IPP) is an application level protocol that can be used for distributed printing
347 using Internet tools and technologies. IPP version 1.1 (IPP/1.1) focuses only on end user functionality.
348 This document is just one of a suite of documents that fully define IPP. The full set of IPP documents
349 includes:

350 Design Goals for an Internet Printing Protocol [RFC2567]
351 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]
352 Internet Printing Protocol/1.1: Model and Semantics (this document)
353 Internet Printing Protocol/1.1: Encoding and Transport [IPP-PRO]
354 Internet Printing Protocol/1.1: Implementer's Guide [IPP-IIG]
355 Mapping between LPD and IPP Protocols [RFC2569]
356

357 Anyone reading these documents for the first time is strongly encouraged to read the IPP documents in the
358 above order.

359 This document is laid out as follows:

- 360 - The rest of Section 1 is an introduction to the IPP simplified model for distributed printing.
- 361 - Section 2 introduces the object types covered in the model with their basic behaviors, attributes, and
362 interactions.
- 363 - Section 3 defines the operations included in IPP/1.1. IPP operations are synchronous, therefore, for
364 each operation, there is a both request and a response.
- 365 - Section 4 defines the attributes (and their syntaxes) that are used in the model.
- 366 - Sections 5 - 6 summarizes the implementation conformance requirements for objects that support the
367 protocol and IANA considerations, respectively.
- 368 - Sections 7 - 11 cover the Internationalization and Security considerations as well as References,
369 Author contact information, and Formats for Registration Proposals.
- 370 - Sections 12 - 14 are appendices that cover Terminology, Status Codes and Messages, and "media"
371 keyword values.

372 Note: This document uses terms such as "attributes", "keywords", and "support". These
373 terms have special meaning and are defined in the model terminology section 12.2.
374 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT,
375 MAY, NEED NOT, and OPTIONAL, have special meaning relating to conformance. These
376 terms are defined in section 12.1 on conformance terminology, most of which is taken from
377 RFC 2119 [RFC2119].

- 378 - Section 15 is an appendix that helps to clarify the effects of interactions between related attributes and
379 their values.
- 380 - Section 16 is an appendix that enumerates the subset of Printer attributes that form a generic directory
381 schema. These attributes are useful when registering a Printer so that a client can find the Printer
382 not just by name, but by filtered searches as well.
- 383 - Section 17 is an appendix summarizing the additions and changes from the IPP/1.0 "Model and
384 Semantics" document [RFC2566] to make this IPP/1.1 document.

385 - Section 18 is the full copyright notice.

386 1.1 Simplified Printing Model

387 In order to achieve its goal of realizing a workable printing protocol for the Internet, the Internet Printing
388 Protocol (IPP) is based on a simplified printing model that abstracts the many components of real world
389 printing solutions. The Internet is a distributed computing environment where requesters of print services
390 (clients, applications, printer drivers, etc.) cooperate and interact with print service providers. This model
391 and semantics document describes a simple, abstract model for IPP even though the underlying
392 configurations may be complex "n-tier" client/server systems. An important simplifying step in the IPP
393 model is to expose only the key objects and interfaces required for printing. The model described in this
394 model document does not include features, interfaces, and relationships that are beyond the scope of the
395 first version of IPP (IPP/1.1). IPP/1.1 incorporates many of the relevant ideas and lessons learned from
396 other specification and development efforts [HTPP] [ISO10175] [LDPA] [P1387.4] [PSIS] [RFC1179]
397 [SWP]. IPP is heavily influenced by the printing model introduced in the Document Printing Application
398 (DPA) [ISO10175] standard. Although DPA specifies both end user and administrative features, IPP
399 version 1.1 (IPP/1.1) focuses primarily on end user functionality with a few additional OPTIONAL operator
400 operations.

401 The IPP/1.1 model encapsulates the important components of distributed printing into two object types:

402 - Printer (Section 2.1)

403 - Job (Section 2.2)

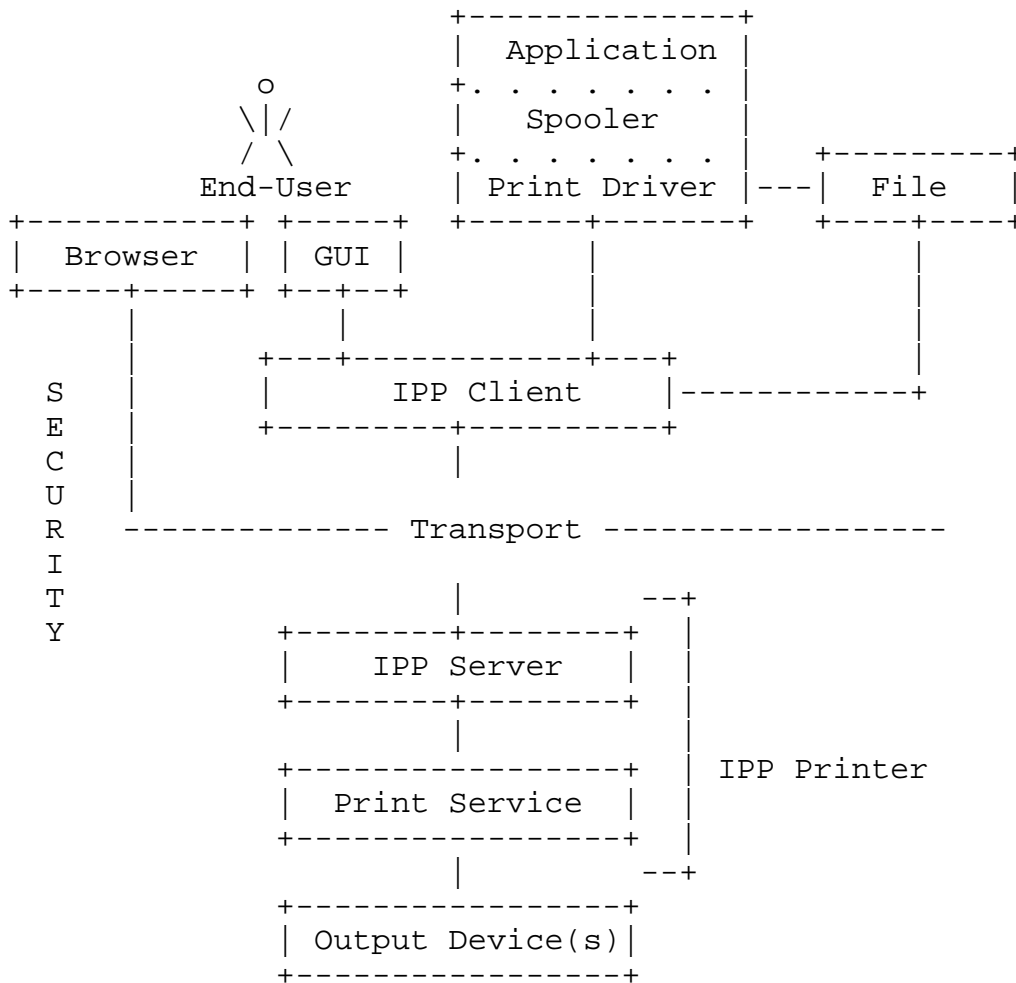

404

405 Each object type has an associated set of operations (see section 3) and attributes (see section 4).

406 It is important, however, to understand that in real system implementations (which lie underneath the
407 abstracted IPP/1.1 model), there are other components of a print service which are not explicitly defined in
408 the IPP/1.1 model. The following figure illustrates where IPP/1.1 fits with respect to these other
409 components.

441 An IPP Printer object encapsulates the functions normally associated with physical output devices along
442 with the spooling, scheduling and multiple device management functions often associated with a print
443 server. Printer objects are optionally registered as entries in a directory where end users find and select them
444 based on some sort of filtered and context based searching mechanism (see section 16). The directory is
445 used to store relatively static information about the Printer, allowing end users to search for and find
446 Printers that match their search criteria, for example: name, context, printer capabilities, etc. The more
447 dynamic information, such as state, currently loaded and ready media, number of jobs at the Printer, errors,
448 warnings, and so forth, is directly associated with the Printer object itself rather than with the entry in the
449 directory which only represents the Printer object.

450 IPP clients implement the IPP protocol on the client side and give end users (or programs running on behalf
451 of end users) the ability to query Printer objects and submit and manage print jobs. An IPP server is just
452 that part of the Printer object that implements the server-side protocol. The rest of the Printer object
453 implements (or gateways into) the application semantics of the print service itself. The Printer objects may
454 be embedded in an output device or may be implemented on a host on the network that communicates with
455 an output device.

456 When a job is submitted to the Printer object and the Printer object validates the attributes in the
457 submission request, the Printer object creates a new Job object. The end user then interacts with this new
458 Job object to query its status and monitor the progress of the job. An end user can also cancel their print
459 jobs by using the Job object's Cancel-Job operation. An end-user can also hold, release, and restart their
460 print jobs using the Job object's OPTIONAL Hold-Job, Release-Job, and Restart-Job operations, if
461 implemented.

462 A privileged operator or administrator of a Printer object can cancel, hold, release, and restart any user's job
463 using the REQUIRED Cancel-Job and the OPTIONAL Hold-Job, Release-Job, and Restart-Job operations.
464 In additional privileged operator or administrator of a Printer object can pause, resume, or purge (jobs from)
465 a Printer object using the OPTIONAL Pause-Printer, Resume-Printer, and Purge-Jobs operations, if
466 implemented.

467 The notification service is out of scope for this IPP/1.1 document, but using such a notification service, the
468 end user is able to register for and receive Printer specific and Job specific events. An end user can query
469 the status of Printer objects and can follow the progress of Job objects by polling using the Get-Printer-
470 Attributes, Get-Jobs, and Get-Job-Attributes operations.

471 2. IPP Objects

472 The IPP/1.1 model introduces objects of type Printer and Job. Each type of object models relevant aspects
473 of a real-world entity such as a real printer or real print job. Each object type is defined as a set of possible
474 attributes that may be supported by instances of that object type. For each object (instance), the actual set
475 of supported attributes and values describe a specific implementation. The object's attributes and values
476 describe its state, capabilities, realizable features, job processing functions, and default behaviors and
477 characteristics. For example, the Printer object type is defined as a set of attributes that each Printer object
478 potentially supports. In the same manner, the Job object type is defined as a set of attributes that are
479 potentially supported by each Job object.

480 Each attribute included in the set of attributes defining an object type is labeled as:

- 481 - "REQUIRED": each object MUST support the attribute.
 - 482 - "RECOMMENDED": each object SHOULD support the attribute.
 - 483 - "OPTIONAL": each object MAY support the attribute.
- 484

485 Some definitions of attribute values indicate that an object MUST or SHOULD support the value;
486 otherwise, support of the value is OPTIONAL. However, if an implementation supports an attribute, it
487 MUST support at least one of the possible values for that attribute.

488 2.1 Printer Object

489 The major component of the IPP/1.1 model is the Printer object. A Printer object implements the server-
490 side of the IPP/1.1 protocol. Using the protocol, end users may query the attributes of the Printer object and
491 submit print jobs to the Printer object. The actual implementation components behind the Printer

492 abstraction may take on different forms and different configurations. However, the model abstraction
493 allows the details of the configuration of real components to remain opaque to the end user. Section 3
494 describes each of the Printer operations in detail.

495 The capabilities and state of a Printer object are described by its attributes. Printer attributes are divided
496 into two groups:

- 497 - "job-template" attributes: These attributes describe supported job processing capabilities and defaults
- 498 for the Printer object. (See section 4.2)
- 499 - "printer-description" attributes: These attributes describe the Printer object's identification, state,
- 500 location, references to other sources of information about the Printer object, etc. (see section 4.4)

501

502 Since a Printer object is an abstraction of a generic document output device and print service provider, a
503 Printer object could be used to represent any real or virtual device with semantics consistent with the
504 Printer object, such as a fax device, an imager, or even a CD writer.

505 Some examples of configurations supporting a Printer object include:

- 506 1) An output device with no spooling capabilities
- 507 2) An output device with a built-in spooler
- 508 3) A print server supporting IPP with one or more associated output devices
- 509 3a) The associated output devices may or may not be capable of spooling jobs
- 510 3b) The associated output devices may or may not support IPP

511

512 The following figures show some examples of how Printer objects can be realized on top of various
513 distributed printing configurations. The embedded case below represents configurations 1 and 2. The
514 hosted and fan-out figures below represent configurations 3a and 3b.

515 In this document the term "client" refers to a software entity that sends IPP operation requests to an IPP
516 Printer object and accepts IPP operation responses. A client MAY be:

- 517 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an
518 application or
- 519 2. the print server component that sends IPP requests to either an output device or another
520 "downstream" print server.

521 The term "IPP Printer" is a network entity that accepts IPP operation requests and returns IPP operation
522 responses. As such, an IPP object MAY be:

- 523 1. an (embedded) device component that accepts IPP requests and controls the device or
- 524 2. a component of a print server that accepts IPP requests (where the print server controls one or more
525 networked devices using IPP or other protocols). **Issue 4**

570 2.2 Job Object

571 A Job object is used to model a print job. A Job object contains documents. The information required to
572 create a Job object is sent in a create request from the end user via an IPP Client to the Printer object. The

573 Printer object validates the create request, and if the Printer object accepts the request, the Printer object
574 creates the new Job object. Section 3 describes each of the Job operations in detail.

575 The characteristics and state of a Job object are described by its attributes. Job attributes are grouped into
576 two groups as follows:

- 577 - "job-template" attributes: These attributes can be supplied by the client or end user and include job
578 processing instructions which are intended to override any Printer object defaults and/or instructions
579 embedded within the document data. (See section 4.2)
- 580 - "job-description" attributes: These attributes describe the Job object's identification, state, size, etc.
581 The client supplies some of these attributes, and the Printer object generates others. (See section 4.3)

582

583 An implementation **MUST** support at least one document per Job object. An implementation **MAY** support
584 multiple documents per Job object. A document is either:

- 585 - a stream of document data in a format supported by the Printer object (typically a Page Description
586 Language - PDL), or
- 587 - a reference to such a stream of document data

588

589 In IPP/1.1, a document is not modeled as an IPP object, therefore it has no object identifier or associated
590 attributes. All job processing instructions are modeled as Job object attributes. These attributes are called
591 Job Template attributes and they apply equally to all documents within a Job object.

592 2.3 Object Relationships

593 IPP objects have relationships that are maintained persistently along with the persistent storage of the object
594 attributes.

595 A Printer object can represent either one or more physical output devices or a logical device which
596 "processes" jobs but never actually uses a physical output device to put marks on paper. Examples of
597 logical devices include a Web page publisher or a gateway into an online document archive or repository.
598 A Printer object contains zero or more Job objects.

599 A Job object is contained by exactly one Printer object, however the identical document data associated
600 with a Job object could be sent to either the same or a different Printer object. In this case, a second Job
601 object would be created which would be almost identical to the first Job object, however it would have new
602 (different) Job object identifiers (see section 2.4).

603 A Job object is either empty (before any documents have been added) or contains one or more documents.
604 If the contained document is a stream of document data, that stream can be contained in only one document.
605 However, there can be identical copies of the stream in other documents in the same or different Job
606 objects. If the contained document is just a reference to a stream of document data, other documents (in the
607 same or different Job object(s)) may contain the same reference.

608 2.4 Object Identity

609 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they
610 can be persistently and unambiguously referenced. The notion of a URI is a useful concept, however, until
611 the notion of URI is more stable (i.e., defined more completely and deployed more widely), it is expected
612 that the URIs used for IPP objects will actually be URLs [RFC2396]. Since every URL is a specialized
613 form of a URI, even though the more generic term URI is used throughout the rest of this document, its
614 usage is intended to cover the more specific notion of URL as well.

615 An administrator configures Printer objects to either support or not support authentication and/or message
616 privacy using TLS [TLS] (the mechanism for security configuration is outside the scope of this IPP/1.1
617 document). In some situations, both types of connections (both authenticated and unauthenticated) can be
618 established using a single communication channel that has some sort of negotiation mechanism. In other
619 situations, multiple communication channels are used, one for each type of security configuration. Section
620 8 provides a full description of all security considerations and configurations.

621 If a Printer object supports more than one communication channel, some or all of those channels might
622 support and/or require different security mechanisms. In such cases, an administrator could expose the
623 simultaneous support for these multiple communication channels as multiple URIs for a single Printer
624 object where each URI represents one of the communication channels to the Printer object. To support this
625 flexibility, the IPP Printer object type defines a multi-valued identification attribute called the "printer-uri-
626 supported" attribute. It **MUST** contain at least one URI. It **MAY** contain more than one URI. That is,
627 every Printer object will have at least one URI that identifies at least one communication channel to the
628 Printer object, but it may have more than one URI where each URI identifies a different communication
629 channel to the Printer object. The "printer-uri-supported" attribute has two companion attributes, the "uri-
630 security-supported" attribute and the "uri-authentication-supported". Both have the same cardinality as
631 "printer-uri-supported". The purpose of the "uri-security-supported" attribute is to indicate the security
632 mechanisms (if any) used for each URI listed in "printer-uri-supported". The purpose of the "uri-
633 authentication-supported" attribute is to indicate the authentication mechanisms (if any) used for each URI
634 listed in "printer-uri-supported". These three attributes are fully described in sections 4.4.1, 4.4.2, and
635 4.4.3. **Issue 2**

636 When a job is submitted to the Printer object via a create request, the client supplies only a single Printer
637 object URI. The client supplied Printer object URI **MUST** be one of the values in the "printer-uri-
638 supported" Printer attribute.

639 IPP/1.1 does not specify how the client obtains the client supplied URI, but it is **RECOMMENDED** that a
640 Printer object be registered as an entry in a directory service. End-users and programs can then interrogate
641 the directory searching for Printers. Section 16 defines a generic schema for Printer object entries in the
642 directory service and describes how the entry acts as a bridge to the actual IPP Printer object. The entry in
643 the directory that represents the IPP Printer object includes the possibly many URIs for that Printer object as
644 values in one its attributes.

645 When a client submits a create request to the Printer object, the Printer object validates the request and
646 creates a new Job object. The Printer object assigns the new Job object a URI which is stored in the "job-
647 uri" Job attribute. This URI is then used by clients as the target for subsequent Job operations. The Printer

648 object generates a Job URI based on its configured security policy and the URI used by the client in the
649 create request.

650 For example, consider a Printer object that supports both a communication channel secured by the use of
651 SSL3 (using HTTP over SSL3 with an "https" schemed URI) and another open communication channel that
652 is not secured with SSL3 (using a simple "http" schemed URI). If a client were to submit a job using the
653 secure URI, the Printer object would assign the new Job object a secure URI as well. If a client were to
654 submit a job using the open-channel URI, the Printer would assign the new Job object an open-channel
655 URI.

656 In addition, the Printer object also populates the Job object's "job-printer-uri" attribute. This is a reference
657 back to the Printer object that created the Job object. If a client only has access to a Job object's "job-uri"
658 identifier, the client can query the Job's "job-printer-uri" attribute in order to determine which Printer object
659 created the Job object. If the Printer object supports more than one URI, the Printer object picks the one
660 URI supplied by the client when creating the job to build the value for and to populate the Job's "job-
661 printer-uri" attribute.

662 Allowing Job objects to have URIs allows for flexibility and scalability. For example, in some
663 implementations, the Printer object might create Jobs that are processed in the same local environment as
664 the Printer object itself. In this case, the Job URI might just be a composition of the Printer's URI and some
665 unique component for the Job object, such as the unique 32-bit positive integer mentioned later in this
666 paragraph. In other implementations, the Printer object might be a central clearing-house for validating all
667 Job object creation requests, but the Job object itself might be created in some environment that is remote
668 from the Printer object. In this case, the Job object's URI may have no physical-location relationship at all
669 to the Printer object's URI. Again, the fact that Job objects have URIs allows for flexibility and scalability,
670 however, many existing printing systems have local models or interface constraints that force print jobs to
671 be identified using only a 32-bit positive integer rather than an independent URI. This numeric Job ID is
672 only unique within the context of the Printer object to which the create request was originally submitted.
673 Therefore, in order to allow both types of client access to IPP Job objects (either by Job URI or by numeric
674 Job ID), when the Printer object successfully processes a create request and creates a new Job object, the
675 Printer object MUST generate both a Job URI and a Job ID. The Job ID (stored in the "job-id" attribute)
676 only has meaning in the context of the Printer object to which the create request was originally submitted.
677 This requirement to support both Job URIs and Job IDs allows all types of clients to access Printer objects
678 and Job objects no matter the local constraints imposed on the client implementation.

679 In addition to identifiers, Printer objects and Job objects have names ("printer-name" and "job-name"). An
680 object name NEED NOT be unique across all instances of all objects. A Printer object's name is chosen and
681 set by an administrator through some mechanism outside the scope of this IPP/1.1 document. A Job
682 object's name is optionally chosen and supplied by the IPP client submitting the job. If the client does not
683 supply a Job object name, the Printer object generates a name for the new Job object. In all cases, the name
684 only has local meaning.

685 To summarize:

686 - Each Printer object is identified with one or more URIs. The Printer's "printer-uri-supported" attribute
687 contains the URI(s).

- 688 - The Printer object's "uri-security-supported" attribute identifies the communication channel security
689 protocols that may or may not have been configured for the various Printer object URIs (e.g., 'tls' or
690 'none').
- 691 - The Printer object's "uri-authentication-supported" attribute identifies the authentication mechanisms
692 that may or may not have been configured for the various Printer object URIs (e.g., 'digest' or
693 'none').
- 694 - Each Job object is identified with a Job URI. The Job's "job-uri" attribute contains the URI.
- 695 - Each Job object is also identified with Job ID which is a 32-bit, positive integer. The Job's "job-id"
696 attribute contains the Job ID. The Job ID is only unique within the context of the Printer object
697 which created the Job object.
- 698 - Each Job object has a "job-printer-uri" attribute which contains the URI of the Printer object that was
699 used to create the Job object. This attribute is used to determine the Printer object that created a Job
700 object when given only the URI for the Job object. This linkage is necessary to determine the
701 languages, charsets, and operations which are supported on that Job (the basis for such support
702 comes from the creating Printer object).
- 703 - Each Printer object has a name (which is not necessarily unique). The administrator chooses and sets
704 this name through some mechanism outside the scope of this IPP/1.1 document. The Printer object's
705 "printer-name" attribute contains the name.
- 706 - Each Job object has a name (which is not necessarily unique). The client optionally supplies this name
707 in the create request. If the client does not supply this name, the Printer object generates a name for
708 the Job object. The Job object's "job-name" attribute contains the name.

709 3. IPP Operations

710 IPP objects support operations. An operation consists of a request and a response. When a client
711 communicates with an IPP object, the client issues an operation request to the URI for that object.
712 Operation requests and responses have parameters that identify the operation. Operations also have
713 attributes that affect the run-time characteristics of the operation (the intended target, localization
714 information, etc.). These operation-specific attributes are called operation attributes (as compared to object
715 attributes such as Printer object attributes or Job object attributes). Each request carries along with it any
716 operation attributes, object attributes, and/or document data required to perform the operation. Each
717 request requires a response from the object. Each response indicates success or failure of the operation with
718 a status code as a response parameter. The response contains any operation attributes, object attributes,
719 and/or status messages generated during the execution of the operation request.

720 This section describes the semantics of the IPP operations, both requests and responses, in terms of the
721 parameters, attributes, and other data associated with each operation.

722 The IPP/1.1 Printer operations are:

- 723 Print-Job (section 3.2.1)
- 724 Print-URI (section 3.2.2)
- 725 Validate-Job (section 3.2.3)
- 726 Create-Job (section 3.2.4)
- 727 Get-Printer-Attributes (section 3.2.5)

728 Get-Jobs (section 3.2.6)
729 Pause-Printer (section 3.3.5)
730 Resume-Printer (section 3.3.6)
731 Purge-Jobs (section 3.3.7)
732

733 The Job operations are:

734 Send-Document (section 3.3.1)
735 Send-URI (section 3.3.2)
736 Cancel-Job (section 3.3.3)
737 Get-Job-Attributes (section 3.3.4)
738 Hold-Job (section 3.3.5)
739 Release-Job (section 3.3.6)
740 Restart-Job (section 3.3.7)
741

742 The Send-Document and Send-URI Job operations are used to add a new document to an existing multi-
743 document Job object created using the Create-Job operation.

744 3.1 Common Semantics

745 All IPP operations require some common parameters and operation attributes. These common elements
746 and their semantic characteristics are defined and described in more detail in the following sections.

747 3.1.1 Required Parameters

748 Every operation request contains the following REQUIRED parameters:

- 749 - a "version-number",
 - 750 - an "operation-id",
 - 751 - a "request-id", and
 - 752 - the attributes that are REQUIRED for that type of request.
- 753

754 Every operation response contains the following REQUIRED parameters:

- 755 - a "version-number",
 - 756 - a "status-code",
 - 757 - the "request-id" that was supplied in the corresponding request, and
 - 758 - the attributes that are REQUIRED for that type of response.
- 759

760 The "Encoding and Transport document [IPP-PRO] defines special rules for the encoding of these
761 parameters. All other operation elements are represented using the more generic encoding rules for
762 attributes and groups of attributes.

763 3.1.2 Operation IDs and Request IDs

764 Each IPP operation request includes an identifying "operation-id" value. Valid values are defined in the
765 "operations-supported" Printer attribute section (see section 4.4.15). The client specifies which operation is
766 being requested by supplying the correct "operation-id" value.

767 In addition, every invocation of an operation is identified by a "request-id" value. For each request, the
768 client chooses the "request-id" which MUST be an integer (possibly unique depending on client
769 requirements) in the range from 1 to $2^{31} - 1$ (inclusive). This "request-id" allows clients to manage
770 multiple outstanding requests. The receiving IPP object copies all 32-bits of the client-supplied "request-id"
771 attribute into the response so that the client can match the response with the correct outstanding request,
772 even if the "request-id" is out of range. If the request is terminated before the complete "request-id" is
773 received, the IPP object rejects the request and returns a response with a "request-id" of 0.

774 Note: In some cases, the transport protocol underneath IPP might be a connection oriented protocol that
775 would make it impossible for a client to receive responses in any order other than the order in which the
776 corresponding requests were sent. In such cases, the "request-id" attribute would not be essential for correct
777 protocol operation. However, in other mappings, the operation responses can come back in any order. In
778 these cases, the "request-id" would be essential.

779 3.1.3 Attributes

780 Operation requests and responses are both composed of groups of attributes and/or document data. The
781 attributes groups are:

- 782 - Operation Attributes: These attributes are passed in the operation and affect the IPP object's behavior
783 while processing the operation request and may affect other attributes or groups of attributes. Some
784 operation attributes describe the document data associated with the print job and are associated with
785 new Job objects, however most operation attributes do not persist beyond the life of the operation.
786 The description of each operation attribute includes conformance statements indicating which
787 operation attributes are REQUIRED and which are OPTIONAL for an IPP object to support and
788 which attributes a client MUST supply in a request and an IPP object MUST supply in a response.
- 789 - Job Template Attributes: These attributes affect the processing of a job. A client OPTIONALLY
790 supplies Job Template Attributes in a create request, and the receiving object MUST be prepared to
791 receive all supported attributes. The Job object can later be queried to find out what Job Template
792 attributes were originally requested in the create request, and such attributes are returned in the
793 response as Job Object Attributes. The Printer object can be queried about its Job Template
794 attributes to find out what type of job processing capabilities are supported and/or what the default
795 job processing behaviors are, though such attributes are returned in the response as Printer Object
796 Attributes. The "ipp-attribute-fidelity" operation attribute affects processing of all client-supplied
797 Job Template attributes (see sections 3.2.1.2 and 15 for a full description of "ipp-attribute-fidelity"
798 and its relationship to other attributes).
- 799 - Job Object Attributes: These attributes are returned in response to a query operation directed at a Job
800 object.
- 801 - Printer Object Attributes: These attributes are returned in response to a query operation directed at a
802 Printer object.

803 - Unsupported Attributes: In a create request, the client supplies a set of Operation and Job Template
804 attributes. If any of these attributes or their values is unsupported by the Printer object, the Printer
805 object returns the set of unsupported attributes in the response. Sections 3.1.7, 3.2.1.2, and 15 give
806 a full description of how Job Template attributes supplied by the client in a create request are
807 processed by the Printer object and how unsupported attributes are returned to the client. Because
808 of extensibility, any IPP object might receive a request that contains new or unknown attributes or
809 values for which it has no support. In such cases, the IPP object processes what it can and returns
810 the unsupported attributes in the response. The Unsupported Attribute group is defined for all
811 operation responses for returning unsupported attributes that the client supplied in the request.
812

813 Later in this section, each operation is formally defined by identifying the allowed and expected groups of
814 attributes for each request and response. The model identifies a specific order for each group in each
815 request or response, but the attributes within each group may be in any order, unless specified otherwise.

816 Each attribute definition includes the attribute's name followed by the name of its attribute syntax(es) in
817 parentheses. In addition, each 'integer' attribute is followed by the allowed range in parentheses, (m:n),
818 for values of that attribute. Each 'text' or 'name' attribute is followed by the maximum size in octets in
819 parentheses, (size), for values of that attribute. For more details on attribute syntax notation, see the
820 descriptions of these attributes syntaxes in section 4.1.

821 Note: Document data included in the operation is not strictly an attribute, but it is treated as a special
822 attribute group for ordering purposes. The only operations that support supplying the document data within
823 an operation request are Print-Job and Send-Document. There are no operation responses that include
824 document data.

825 Some operations are REQUIRED for IPP objects to support; the others are OPTIONAL (see section 5.2.2).
826 Therefore, before using an OPTIONAL operation, a client SHOULD first use the REQUIRED Get-Printer-
827 Attributes operation to query the Printer's "operations-supported" attribute in order to determine which
828 OPTIONAL Printer and Job operations are actually supported. The client SHOULD NOT use an
829 OPTIONAL operation that is not supported. When an IPP object receives a request to perform an operation
830 it does not support, it returns the 'server-error-operation-not-supported' status code (see section 13.1.5.2).
831 An IPP object is non-conformant if it does not support a REQUIRED operation.

832 3.1.4 Character Set and Natural Language Operation Attributes

833 Some Job and Printer attributes have values that are text strings and names intended for human
834 understanding rather than machine understanding (see the 'text' and 'name' attribute syntax descriptions in
835 section 4.1). The following sections describe two special Operation Attributes called "attributes-charset"
836 and "attributes-natural-language". These attributes are always part of the Operation Attributes group. For
837 most attribute groups, the order of the attributes within the group is not important. However, for these two
838 attributes within the Operation Attributes group, the order is critical. The "attributes-charset" attribute
839 MUST be the first attribute in the group and the "attributes-natural-language" attribute MUST be the second
840 attribute in the group. In other words, these attributes MUST be supplied in every IPP request and
841 response, they MUST come first in the group, and MUST come in the specified order. For job creation
842 operations, the IPP Printer implementation saves these two attributes with the new Job object as Job

843 Description attributes. For the sake of brevity in this document, these operation attribute descriptions are
844 not repeated with every operation request and response, but have a reference back to this section instead.

845 3.1.4.1 Request Operation Attributes

846 The client **MUST** supply and the Printer object **MUST** support the following **REQUIRED** operation
847 attributes in every IPP/1.1 operation request:

848 "attributes-charset" (charset):

849 This operation attribute identifies the charset (coded character set and encoding method) used by
850 any 'text' and 'name' attributes that the client is supplying in this request. It also identifies the
851 charset that the Printer object **MUST** use (if supported) for all 'text' and 'name' attributes and status
852 messages that the Printer object returns in the response to this request. See Sections 4.1.1 and 4.1.2
853 for the definition of the 'text' and 'name' attribute syntaxes.

854
855 All clients and IPP objects **MUST** support the 'utf-8' charset [RFC2279] and **MAY** support
856 additional charsets provided that they are registered with IANA [IANA-CS]. If the Printer object
857 does not support the client supplied charset value, the Printer object **MUST** reject the request, set
858 the "attributes-charset" to 'utf-8' in the response, and return the 'client-error-charset-not-supported'
859 status code and any 'text' or 'name' attributes using the 'utf-8' charset. The Printer **NEED NOT** return
860 any attributes in the Unsupported Attributes Group (See sections 3.1.7 and 3.2.1.2). The Printer
861 object **MUST** indicate the charset(s) supported as the values of the "charset-supported" Printer
862 attribute (see Section 4.4.18), so that the client can query to determine which charset(s) are
863 supported.

864
865 Note to client implementers: Since IPP objects are only required to support the 'utf-8' charset, in
866 order to maximize interoperability with multiple IPP object implementations, a client may want to
867 supply 'utf-8' in the "attributes-charset" operation attribute, even though the client is only passing
868 and able to present a simpler charset, such as US-ASCII or ISO-8859-1. Then the client will have to
869 filter out (or charset convert) those characters that are returned in the response that it cannot present
870 to its user. On the other hand, if both the client and the IPP objects also support a charset in
871 common besides utf-8, the client may want to use that charset in order to avoid charset conversion
872 or data loss.

873
874 See the 'charset' attribute syntax description in Section 4.1.7 for the syntax and semantic
875 interpretation of the values of this attribute and for example values.

876
877 "attributes-natural-language" (naturalLanguage):

878 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that
879 the client is supplying in this request. This attribute also identifies the natural language that the
880 Printer object **SHOULD** use for all 'text' and 'name' attributes and status messages that the Printer
881 object returns in the response to this request.

882
883 There are no **REQUIRED** natural languages required for the Printer object to support. However, the
884 Printer object's "generated-natural-language-supported" attribute identifies the natural languages
885 supported by the Printer object and any contained Job objects for all text strings generated by the

886 IPP object. A client MAY query this attribute to determine which natural language(s) are supported
887 for generated messages.

888

889 For any of the attributes for which the Printer object generates text, i.e., for the "job-state-message",
890 "printer-state-message", and status messages (see Section 3.1.6), the Printer object MUST be able to
891 generate these text strings in any of its supported natural languages. If the client requests a natural
892 language that is not supported, the Printer object MUST return these generated messages in the
893 Printer's configured natural language as specified by the Printer's "natural-language-configured"
894 attribute" (see Section 4.4.19).

895

896 For other 'text' and 'name' attributes supplied by the client, authentication system, operator, system
897 administrator, or manufacturer (i.e., for "job-originating-user-name", "printer-name" (name),
898 "printer-location" (text), "printer-info" (text), and "printer-make-and-model" (text)), the Printer
899 object is only required to support the configured natural language of the Printer identified by the
900 Printer object's "natural-language-configured" attribute, though support of additional natural
901 languages for these attributes is permitted.

902

903 For any 'text' or 'name' attribute in the request that is in a different natural language than the value
904 supplied in the "attributes-natural-language" operation attribute, the client MUST use the Natural
905 Language Override mechanism (see sections 4.1.1.2 and 4.1.2.2) for each such attribute value
906 supplied. The client MAY use the Natural Language Override mechanism redundantly, i.e., use it
907 even when the value is in the same natural language as the value supplied in the "attributes-natural-
908 language" operation attribute of the request.

909

910 The IPP object MUST accept any natural language and any Natural Language Override, whether the
911 IPP object supports that natural language or not (and independent of the value of the "ipp-attribute-
912 fidelity" Operation attribute). That is the IPP object accepts all client supplied values no matter
913 what the values are in the Printer object's "generated-natural-language-supported" attribute. That
914 attribute, "generated-natural-language-supported", only applies to generated messages, not client
915 supplied messages. The IPP object MUST remember that natural language for all client-supplied
916 attributes, and when returning those attributes in response to a query, the IPP object MUST indicate
917 that natural language.

918

919 Each value whose attribute syntax type is 'text' or 'name' (see sections 4.1.1 and 4.1.2) has an
920 Associated Natural-Language. This document does not specify how this association is stored in a
921 Printer or Job object. When such a value is encoded in a request or response, the natural language is
922 either implicit or explicit:

923

- 924 – In the implicit case, the value contains only the text/name value, and the language is
925 specified by the "attributes-natural-language" operation attribute in the request or response
926 (see sections 4.1.1.1 textWithoutLanguage and 4.1.2.1 nameWithoutLanguage).
 - 927 – In the explicit case (also known as the Natural-Language Override case), the value contains
928 both the language and the text/name value (see sections 4.1.1.2 textWithLanguage and
929 4.1.2.2 nameWithLanguage).
- 930

931
932
933
934
935
936
937
938
939
940
941
942
943
944
945
946
947
948

For example, the "job-name" attribute MAY be supplied by the client in a create request. The text value for this attribute will be in the natural language identified by the "attribute-natural-language" attribute, or if different, as identified by the Natural Language Override mechanism. If supplied, the IPP object will use the value of the "job-name" attribute to populate the Job object's "job-name" attribute. Whenever any client queries the Job object's "job-name" attribute, the IPP object returns the attribute as stored and uses the Natural Language Override mechanism to specify the natural language, if it is different from that reported in the "attributes-natural-language" operation attribute of the response. The IPP object MAY use the Natural Language Override mechanism redundantly, i.e., use it even when the value is in the same natural language as the value supplied in the "attributes-natural-language" operation attribute of the response.

An IPP object MUST NOT reject a request based on a supplied natural language in an "attributes-natural-language" Operation attribute or in any attribute that uses the Natural Language Override.

See the 'naturalLanguage' attribute syntax description in section 4.1.8 for the syntax and semantic interpretation of the values of this attribute and for example values.

949
950
951
952
953
954

Clients SHOULD NOT supply 'text' or 'name' attributes that use an illegal combination of natural language and charset. For example, suppose a Printer object supports charsets 'utf-8', 'iso-8859-1', and 'iso-8859-7'. Suppose also, that it supports natural languages 'en' (English), 'fr' (French), and 'el' (Greek). Although the Printer object supports the charset 'iso-8859-1' and natural language 'el', it probably does not support the combination of Greek text strings using the 'iso-8859-1' charset. The Printer object handles this apparent incompatibility differently depending on the context in which it occurs:

955
956
957
958
959
960
961
962
963

- In a create request: If the client supplies a text or name attribute (for example, the "job-name" operation attribute) that uses an apparently incompatible combination, it is a client choice that does not affect the Printer object or its correct operation. Therefore, the Printer object simply accepts the client supplied value, stores it with the Job object, and responds back with the same combination whenever the client (or any client) queries for that attribute.
- In a query-type operation, like Get-Printer-Attributes: If the client requests an apparently incompatible combination, the Printer object responds (as described in section 3.1.4.2) using the Printer's configured natural language rather than the natural language requested by the client.

964
965
966
967
968

In either case, the Printer object does not reject the request because of the apparent incompatibility. The potential incompatible combination of charset and natural language can occur either at the global operation level or at the Natural Language Override attribute-by-attribute level. In addition, since the response always includes explicit charset and natural language information, there is never any question or ambiguity in how the client interprets the response.

969

3.1.4.2 Response Operation Attributes

970
971

The Printer object MUST supply and the client MUST support the following REQUIRED operation attributes in every IPP/1.1 operation response:

972 "attributes-charset" (charset):

973 This operation attribute identifies the charset used by any 'text' and 'name' attributes that the Printer
974 object is returning in this response. The value in this response MUST be the same value as the
975 "attributes-charset" operation attribute supplied by the client in the request. If this is not possible
976 (i.e., the charset requested is not supported), the request would have been rejected. See "attributes-
977 charset" described in Section 3.1.4.1 above.

978
979 If the Printer object supports more than just the 'utf-8' charset, the Printer object MUST be able to
980 code convert between each of the charsets supported on a highest fidelity possible basis in order to
981 return the 'text' and 'name' attributes in the charset requested by the client. However, some
982 information loss MAY occur during the charset conversion depending on the charsets involved. For
983 example, the Printer object may convert from a UTF-8 'a' to a US-ASCII 'a' (with no loss of
984 information), from an ISO Latin 1 CAPITAL LETTER A WITH ACUTE ACCENT to US-ASCII
985 'A' (losing the accent), or from a UTF-8 Japanese Kanji character to some ISO Latin 1 error
986 character indication such as '?', decimal code equivalent, or to the absence of a character, depending
987 on implementation.

988
989 Whether an implementation that supports more than one charset stores the data in the charset
990 supplied by the client or code converts to one of the other supported charsets, depends on
991 implementation. The strategy should try to minimize loss of information during code conversion.
992 On each response, such an implementation converts from its internal charset to that requested.

993
994 "attributes-natural-language" (naturalLanguage):

995 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that
996 the IPP object is returning in this response. Unlike the "attributes-charset" operation attribute, the
997 IPP object NEED NOT return the same value as that supplied by the client in the request. The IPP
998 object MAY return the natural language of the Job object or the Printer's configured natural
999 language as identified by the Printer object's "natural-language-configured" attribute, rather than the
1000 natural language supplied by the client. For any 'text' or 'name' attribute or status message in the
1001 response that is in a different natural language than the value returned in the "attributes-natural-
1002 language" operation attribute, the IPP object MUST use the Natural Language Override mechanism
1003 (see sections 4.1.1.2 and 4.1.2.2) on each attribute value returned. The IPP object MAY use the
1004 Natural Language Override mechanism redundantly, i.e., use it even when the value is in the same
1005 natural language as the value supplied in the "attributes-natural-language" operation attribute of the
1006 response.

1007 3.1.5 Operation Targets

1008 All IPP operations are directed at IPP objects. For Printer operations, the operation is always directed at a
1009 Printer object using one of its URIs (i.e., one of the values in the Printer object's "printer-uri-supported"
1010 attribute). Even if the Printer object supports more than one URI, the client supplies only one URI as the
1011 target of the operation. The client identifies the target object by supplying the correct URI in the "printer-
1012 uri (uri)" operation attribute.

1013 For Job operations, the operation is directed at either:

- 1014 - The Job object itself using the Job object's URI. In this case, the client identifies the target object by
1015 supplying the correct URI in the "job-uri (uri)" operation attribute.
- 1016 - The Printer object that created the Job object using both the Printer objects URI and the Job object's
1017 Job ID. Since the Printer object that created the Job object generated the Job ID, it **MUST** be able to
1018 correctly associate the client supplied Job ID with the correct Job object. The client supplies the
1019 Printer object's URI in the "printer-uri (uri)" operation attribute and the Job object's Job ID in the
1020 "job-id (integer(1:MAX))" operation attribute.

1022 If the operation is directed at the Job object directly using the Job object's URI, the client **MUST NOT**
1023 include the redundant "job-id" operation attribute.

1024 The operation target attributes are **REQUIRED** operation attributes that **MUST** be included in every
1025 operation request. Like the charset and natural language attributes (see section 3.1.4), the operation target
1026 attributes are specially ordered operation attributes. In all cases, the operation target attributes immediately
1027 follow the "attributes-charset" and "attributes-natural-language" attributes within the operation attribute
1028 group, however the specific ordering rules are:

- 1029 - In the case where there is only one operation target attribute (i.e., either only the "printer-uri" attribute
1030 or only the "job-uri" attribute), that attribute **MUST** be the third attribute in the operation attributes
1031 group.
- 1032 - In the case where Job operations use two operation target attributes (i.e., the "printer-uri" and "job-id"
1033 attributes), the "printer-uri" attribute **MUST** be the third attribute and the "job-id" attribute **MUST**
1034 be the fourth attribute.

1036 In all cases, the target URIs contained within the body of IPP operation requests and responses must be in
1037 absolute format rather than relative format (a relative URL identifies a resource with the scope of the HTTP
1038 server, but does not include scheme, host or port).

1039 The following rules apply to the use of port numbers in URIs that identify IPP objects:

- 1040 1. If the URI scheme allows the port number to be explicitly included in the URI string, and a port
1041 number is specified within the URI, then that port number **MUST** be used by the client to contact
1042 the IPP object.
- 1043 2. If the URI scheme allows the port number to be explicitly included in the URI string, and a port
1044 number is not specified within the URI, then default port number implied by that URI scheme
1045 **MUST** be used by the client to contact the IPP object.
- 1046 3. If the URI scheme does not allow an explicit port number to be specified within the URI, then the
1047 default port number implied by that URI **MUST** be used by the client to contact the IPP object.

1051 Note: The IPP "Encoding and Transport document [IPP-PRO] shows a mapping of IPP onto HTTP/1.1 and
1052 defines a new default port number for using IPP over HTTP/1.1.

1053 3.1.6 Operation Response Status Codes and Status Messages

1054 Every operation response includes a REQUIRED "status-code" parameter and an OPTIONAL "status-
 1055 message" operation attribute, and an OPTIONAL "detailed-status-message" operation attribute. The Print-
 1056 URI and Send-URI response MAY include an OPTIONAL "document-access-error" operation attribute.

1057 3.1.6.1 "status-code" (type2 enum)

1058 The REQUIRED "status-code" parameter provides information on the processing of a request.

1059 The status code is intended for use by automata. A client implementation of IPP SHOULD convert status
 1060 code values into any localized message that has semantic meaning to the end user.

1061 The "status-code" value is a numeric value that has semantic meaning. The "status-code" syntax is similar
 1062 to a "type2 enum" (see section 4.1 on "Attribute Syntaxes") except that values can range only from 0x0000
 1063 to 0x7FFF. Section 13 describes the status codes, assigns the numeric values, and suggests a corresponding
 1064 status message for each status code for use by the client when the user's natural language is English.

1065 If the Printer performs an operation with no errors and it encounters no problems, it MUST return the status
 1066 code 'successful-ok' in the response. See section 13.

1067 If the client supplies unsupported values for the following parameters or Operation attributes, the Printer
 1068 object MUST reject the operation, NEED NOT return the unsupported attribute value in the Unsupported
 1069 Attributes group, and MUST return the indicated status code:

Parameter/Attribute	Status code
version-number	server-error-version-not-supported
operation-id	server-error-operation-not-supported
attributes-charset	client-error-charset-not-supported
compression	client-error-compression-not-supported
document-format	client-error-document-format-not-supported
document-uri	client-error-uri-scheme-not-supported, client-error-document-access-error

1070

1071 If the client supplies unsupported values for other attributes, or unsupported attributes, the Printer returns
 1072 the status code defined in section 3.1.7 on Unsupported Attributes. **Issue 18**

1073 3.1.6.2 "status-message" (text(255))

1074 The OPTIONAL "status-message" operation attribute provides a short textual description of the status of
 1075 the operation. The "status-message" attribute's syntax is "text(255)", so the maximum length is 255 octets
 1076 (see section 4.1.1). The status message is intended for the human end user. If a response does include a
 1077 "status-message" attribute, an IPP client NEED NOT examine or display the messages, however it
 1078 SHOULD do so in some implementation specific manner. The "status-message" is especially useful for a
 1079 later version of a Printer object to return as supplemental information for the human user to accompany a
 1080 status code that an earlier version of a client might not understand.

1081 If the Printer object supports the "status-message" operation attribute, the Printer object MUST be able to
1082 generate this message in any of the natural languages identified by the Printer object's "generated-natural-
1083 language-supported" attribute (see the "attributes-natural-language" operation attribute specified in section
1084 3.1.4.1. Section 13 suggests the text for the status message returned by the Printer for use with the English
1085 natural language.

1086 As described in section 3.1.4.1 for any returned 'text' attribute, if there is a choice for generating this
1087 message, the Printer object uses the natural language indicated by the value of the "attributes-natural-
1088 language" in the client request if supported, otherwise the Printer object uses the value in the Printer
1089 object's own "natural-language-configured" attribute.

1090 If the Printer object supports the "status-message" operation attribute, it SHOULD use the REQUIRED 'utf-
1091 8' charset to return a status message for the following error status codes (see section 13): 'client-error-bad-
1092 request', 'client-error-charset-not-supported', 'server-error-internal-error', 'server-error-operation-not-
1093 supported', and 'server-error-version-not-supported'. In this case, it MUST set the value of the "attributes-
1094 charset" operation attribute to 'utf-8' in the error response.

1095 3.1.6.3 "detailed-status-message" (text(MAX)) **Issue 35**

1096 The OPTIONAL "detailed-status-message" operation attribute provides additional more detailed technical
1097 and implementation-specific information about the operation. The "detailed-status-message" attribute's
1098 syntax is "text(MAX)", so the maximum length is 1023 octets (see section 4.1.1). If the Printer objects
1099 supports the "detailed-status-message" operation attribute, neither the Printer nor the client localizes the
1100 message, since it is intended for use by the system administrator or other experienced technical persons.
1101 Clients MUST NOT attempt to parse the value of this attribute. See the "document-access-error" operation
1102 attribute (section 3.1.6.4) for additional errors that a program can process.

1103 3.1.6.4 "document-access-error" (text(MAX)) **Issue 35**

1104 This OPTIONAL operation attribute provides additional information about any document access errors
1105 encountered by the Printer before it returned a response to the Print-URI (section 3.2.2) or Send-URI
1106 (section 3.3.1) operation. For errors in the protocol identified by the URI scheme in the "document-uri"
1107 operation attribute, such as 'http:' or 'ftp:', the error code is returned in parentheses, followed by the URI.
1108 For example:

```
1109     (404) http://ftp.pwg.org/pub/pwg/ipp/new_MOD/ipp-model-v11-990510.pdf  
1110
```

1111 Most Internet protocols use decimal error codes (unlike IPP), so the ASCII error code representation is in
1112 decimal.

1113 3.1.7 Unsupported Attributes

1114 The Unsupported Attributes group contains attributes that are not supported by the operation. This group is
1115 primarily for the job creation operations, but all operations can return this group.

1116 A Printer object **MUST** include an Unsupported Attributes group in a response if the status code is one of
1117 the following: 'successful-ok-ignored-or-substituted-attributes', 'successful-ok-conflicting-attributes', 'client-
1118 error-attributes-or-values-not-supported' or 'client-error-conflicting-attributes'.

1119 If the status code is one of the four specified in the preceding paragraph, the Unsupported Attributes group
1120 **MUST** contain all of those attributes and only those attributes that are:

- 1121 a. an Operation or Job Template attribute supplied in the request, and
- 1122 b. unsupported by the printer. See below for details on the three categories "unsupported" attributes.
1123 [Issue 18, Issue 23, and Issue 27](#)

1124 If the Printer object is not returning any Unsupported Attributes in the response, the Printer object
1125 **SHOULD** omit Group 2 rather than sending an empty group. However, a client **MUST** be able to accept an
1126 empty group.

1127 Unsupported attributes fall into three categories:

- 1128 1. The Printer object does not support the supplied attribute (no matter what the attribute syntax or
1129 value).
- 1130 2. The Printer object does support the attribute, but does not support some or all of the particular
1131 attribute syntaxes or values supplied by the client (i.e., the Printer object does not have those
1132 attribute syntaxes or values in its corresponding "xxx-supported" attribute).
- 1133 3. The Printer object does support the attributes and values supplied, but the particular values are in
1134 conflict with one another, because they violate a constraint, such as not being able to staple
1135 transparencies.

1136 In the case of an unsupported attribute name, the Printer object returns the client-supplied attribute with a
1137 substituted value of 'unsupported'. This value's syntax type is "out-of-band" and its encoding is defined by
1138 special rules for "out-of-band" values in the "Encoding and Transport" document [IPP-PRO]. Its value
1139 indicates no support for the attribute itself (see the beginning of section 4.1). [Issue 12](#)

1140 In the case of a supported attribute with one or more unsupported attribute syntaxes or values, the Printer
1141 object simply returns the client-supplied attribute with the unsupported attribute syntaxes or values as
1142 supplied by the client. This indicates support for the attribute, but no support for that particular attribute
1143 syntax or value. If the client supplies a multi-valued attribute with more than one value and the Printer
1144 object supports the attribute but only supports a subset of the client-supplied attribute syntaxes or values,
1145 the Printer object **MUST** return only those attribute syntaxes or values that are unsupported.

1146 In the case of two (or more) supported attribute values that are in conflict with one another (although each
1147 is supported independently, the values conflict when requested together within the same job), the Printer
1148 object **MUST** return all the values that it ignores or substitutes to resolve the conflict, but not any of the
1149 values that it is still using. The choice for exactly how to resolve the conflict is implementation dependent.
1150 See sections 3.2.1.2 and 15. See The Implementer's Guide [IPP-IIG] for an example.

1151 3.1.8 Versions

1152 Each operation request and response carries with it a "version-number" parameter. Each value of the
1153 "version-number" is in the form "X.Y" where X is the major version number and Y is the minor version
1154 number. By including a version number in the client request, it allows the client to identify which version
1155 of IPP it is interested in using, i.e., the version whose conformance requirements the client may be
1156 depending upon the Printer to meet.

1157 If the IPP object does not support that major version number supplied by the client, i.e., the major version
1158 field of the "version-number" parameter does not match any of the values of the Printer's "ipp-versions-
1159 supported" (see section 4.4.14), the object MUST respond with a status code of 'server-error-version-not-
1160 supported' along with the closest version number that is supported (see section 13.1.5.4). If the major
1161 version number is supported, but the minor version number is not, the IPP object SHOULD accept and
1162 attempt to perform the request (or reject the request if the operation is not supported), else it rejects the
1163 request and returns the 'server-error-version-not-supported' status code. In all cases, the IPP object MUST
1164 return the "version-number" that it supports that is closest to the version number supplied by the client in
1165 the request.

1166 There is no version negotiation per se. However, if after receiving a 'server-error-version-not-supported'
1167 status code from an IPP object, a client SHOULD try again with a different version number. A client MAY
1168 also determine the versions supported either from a directory that conforms to Appendix E (see section 16)
1169 or by querying the Printer object's "ipp-versions-supported" attribute (see section 4.4.14) to determine
1170 which versions are supported. **Issue 36**

1171 An IPP object implementation MUST support version '1.1', i.e., meet the conformance requirements for
1172 IPP/1.1 as specified in this document and [IPP-PRO]. An IPP object implementation SHOULD support
1173 version '1.0', i.e., meet the conformance requirements for IPP/1.0 [RFC2566 and RFC2565]. **Issue 36**

1174 There is only one notion of "version number" that covers both IPP Model and IPP Protocol changes. Thus
1175 the version number MUST change when introducing a new version of the Model and Semantics document
1176 (this document) or a new version of the "Encoding and Transport" document [IPP-PRO].

1177 Changes to the major version number of the Model and Semantics document indicate structural or syntactic
1178 changes that make it impossible for older version of IPP clients and Printer objects to correctly parse and
1179 correctly process the new or changed attributes, operations and responses. If the major version number
1180 changes, the minor version numbers is set to zero. As an example, adding the REQUIRED "ipp-attribute-
1181 fidelity" attribute to version '1.1' (if it had not been part of version '1.0'), would have required a change to
1182 the major version number, since an IPP/1.0 Printer would not have processed a request with the correct
1183 semantics that contained the "ipp-attribute-fidelity" attribute that it did not know about. Items that might
1184 affect the changing of the major version number include any changes to the Model and Semantics document
1185 (this document) or the "Encoding and Transport" document [IPP-PRO] itself, such as:

- 1186 - reordering of ordered attributes or attribute sets
- 1187 - changes to the syntax of existing attributes
- 1188 - adding REQUIRED (for an IPP object to support) operation attribute groups
- 1189 - adding values to existing REQUIRED operation attributes
- 1190 - adding REQUIRED operations

1191

1192 Changes to the minor version number indicate the addition of new features, attributes and attribute values
1193 that may not be understood by all IPP objects, but which can be ignored if not understood. Items that might
1194 affect the changing of the minor version number include any changes to the model objects and attributes but
1195 not the encoding and transport rules [IPP-PRO] (except adding attribute syntaxes). Examples of such
1196 changes are:

- 1197 - grouping all extensions not included in a previous version into a new version
- 1198 - adding new attribute values
- 1199 - adding new object attributes
- 1200 - adding OPTIONAL (for an IPP object to support) operation attributes (i.e., those attributes that an IPP
1201 object can ignore without confusing clients)
- 1202 - adding OPTIONAL (for an IPP object to support) operation attribute groups (i.e., those attributes that
1203 an IPP object can ignore without confusing clients)
- 1204 - adding new attribute syntaxes
- 1205 - adding OPTIONAL operations
- 1206 - changing Job Description attributes or Printer Description attributes from OPTIONAL to REQUIRED
1207 or vice versa.
- 1208 - adding OPTIONAL attribute syntaxes to an existing attribute. **Issue 33**

1209 The encoding of the "version-number" MUST NOT change over any version number (either major or
1210 minor). This rule guarantees that all future versions will be backwards compatible with all previous
1211 versions (at least for checking the "version-number"). In addition, any protocol elements (attributes, error
1212 codes, tags, etc.) that are not carried forward from one version to the next are deprecated so that they can
1213 never be reused with new semantics.

1214 Implementations that support a certain version NEED NOT support ALL previous versions. As each new
1215 version is defined (through the release of a new IPP specification document), that version will specify
1216 which previous versions MUST and which versions SHOULD be supported in compliant implementations.
1217 **Issue 36**

1218 3.1.9 Job Creation Operations

1219 In order to "submit a print job" and create a new Job object, a client issues a create request. A create
1220 request is any one of following three operation requests:

- 1221 - The Print-Job Request: A client that wants to submit a print job with only a single document uses the
1222 Print-Job operation. The operation allows for the client to "push" the document data to the Printer
1223 object by including the document data in the request itself.
1224
- 1225 - The Print-URI Request: A client that wants to submit a print job with only a single document (where
1226 the Printer object "pulls" the document data instead of the client "pushing" the data to the Printer
1227 object) uses the Print-URI operation. In this case, the client includes in the request only a URI
1228 reference to the document data (not the document data itself).
1229
- 1230 - The Create-Job Request: A client that wants to submit a print job with multiple documents uses the
1231 Create-Job operation. This operation is followed by an arbitrary number of Send-Document and/or

1232 Send-URI operations (each creating another document for the newly create Job object). The Send-
1233 Document operation includes the document data in the request (the client "pushes" the document
1234 data to the printer), and the Send-URI operation includes only a URI reference to the document data
1235 in the request (the Printer "pulls" the document data from the referenced location). The last Send-
1236 Document or Send-URI request for a given Job object includes a "last-document" operation attribute
1237 set to 'true' indicating that this is the last request.
1238

1239 Throughout this model document, the term "create request" is used to refer to any of these three operation
1240 requests.

1241 A Create-Job operation followed by only one Send-Document operation is semantically equivalent to a
1242 Print-Job operation, however, for performance reasons, the client SHOULD use the Print-Job operation for
1243 all single document jobs. Also, Print-Job is a REQUIRED operation (all implementations MUST support
1244 it) whereas Create-Job is an OPTIONAL operation, hence some implementations might not support it.

1245 Job submission time is the point in time when a client issues a create request. The initial state of every Job
1246 object is the 'pending', 'pending-held', or 'processing' state (see section 4.3.7). **Issue 13** When the Printer
1247 object begins processing the print job, the Job object's state moves to 'processing'. This is known as job
1248 processing time. There are validation checks that must be done at job submission time and others that must
1249 be performed at job processing time.

1250 At job submission time and at the time a Validate-Job operation is received, the Printer MUST do the
1251 following:

- 1252 1. Process the client supplied attributes and either accept or reject the request
- 1253 2. Validate the syntax of and support for the scheme of any client supplied URI

1254

1255 At job submission time the Printer object MUST validate whether or not the supplied attributes, attribute
1256 syntaxes, and values are supported by matching them with the Printer object's corresponding "xxx-
1257 supported" attributes. See section 3.1.7 for details. [IPP-IIG] presents suggested steps for an IPP object to
1258 either accept or reject any request and additional steps for processing create requests.

1259 At job submission time the Printer object NEED NOT perform the validation checks reserved for job
1260 processing time such as:

- 1261 1. Validating the document data
- 1262 2. Validating the actual contents of any client supplied URI (resolve the reference and follow the link to
1263 the document data)

1264

1265 At job submission time, these additional job processing time validation checks are essentially useless, since
1266 they require actually parsing and interpreting the document data, are not guaranteed to be 100% accurate,
1267 and MUST be done, yet again, at job processing time. Also, in the case of a URI, checking for availability
1268 at job submission time does not guarantee availability at job processing time. In addition, at job processing
1269 time, the Printer object might discover any of the following conditions that were not detectable at job
1270 submission time:

- 1271 - runtime errors in the document data,
1272 - nested document data that is in an unsupported format,
1273 - the URI reference is no longer valid (i.e., the server hosting the document might be down), or
1274 - any other job processing error
1275

1276 At job submission time, a Printer object, especially a non-spooling Printer, MAY accept jobs that it does
1277 not have enough space for. In such a situation, a Printer object MAY stop reading data from a client for an
1278 indefinite period of time. A client MUST be prepared for a write operation to block for an indefinite period
1279 of time (see section 5.1 on client conformance).

1280 When a Printer object has too little space for starting a new job, it MAY reject a new create request. In this
1281 case, a Printer object MUST return a response (in reply to the rejected request) with a status-code of 'server-
1282 error-busy' (see section 14.1.5.8) and it MAY close the connection before receiving all bytes of the
1283 operation. A Printer SHOULD indicate that it is temporarily unable to accept jobs by setting the 'spool-
1284 space-full' value in its "printer-state-reasons" attribute and removing the value when it can accept another
1285 job (see section 4.4.12).

1286 When receiving a 'server-error-busy' status-code in an operation response, a client MUST be prepared for
1287 the Printer object to close the connection before the client has sent all of the data (especially for the Print-
1288 Job operation). A client MUST be prepared to keep submitting a create request until the IPP Printer object
1289 accepts the create request. **Issue 20**

1290 At job processing time, since the Printer object has already responded with a successful status code in the
1291 response to the create request, if the Printer object detects an error, the Printer object is unable to inform the
1292 end user of the error with an operation status code. In this case, the Printer, depending on the error, can set
1293 the job object's "job-state", "job-state-reasons", or "job-state-message" attributes to the appropriate value(s)
1294 so that later queries can report the correct job status.

1295 Note: Asynchronous notification of events is outside the scope of this IPP/1.1 document.

1296

1297 3.2 Printer Operations

1298 All Printer operations are directed at Printer objects. A client MUST always supply the "printer-uri"
1299 operation attribute in order to identify the correct target of the operation.

1300 3.2.1 Print-Job Operation

1301 This REQUIRED operation allows a client to submit a print job with only one document and supply the
1302 document data (rather than just a reference to the data). See Section 15 for the suggested steps for
1303 processing create operations and their Operation and Job Template attributes.

1304 3.2.1.1 Print-Job Request

1305 The following groups of attributes are supplied as part of the Print-Job Request:

1306 Group 1: Operation Attributes

1307 Natural Language and Character Set:

1308 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.
1309 The Printer object MUST copy these values to the corresponding Job Description attributes
1310 described in sections 4.3.19 and 4.3.20.

1311

1312 Target:

1313 The "printer-uri" (uri) operation attribute which is the target for this operation as described in
1314 section 3.1.5.

1315

1316 Requesting User Name:

1317 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
1318 described in section 8.3.

1319

1320 "job-name" (name(MAX)):

1321 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It
1322 contains the client supplied Job name. If this attribute is supplied by the client, its value is used for
1323 the "job-name" attribute of the newly created Job object. The client MAY automatically include any
1324 information that will help the end-user distinguish amongst his/her jobs, such as the name of the
1325 application program along with information from the document, such as the document name,
1326 document subject, or source file name. If this attribute is not supplied by the client, the Printer
1327 generates a name to use in the "job-name" attribute of the newly created Job object (see Section
1328 4.3.5).

1329

1330 "ipp-attribute-fidelity" (boolean):

1331 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.
1332 The value 'true' indicates that total fidelity to client supplied Job Template attributes and values is
1333 required, else the Printer object MUST reject the Print-Job request. The value 'false' indicates that a
1334 reasonable attempt to print the Job object is acceptable and the Printer object MUST accept the
1335 Print-job request. If not supplied, the Printer object assumes the value is 'false'. All Printer objects
1336 MUST support both types of job processing. See section 15 for a full description of "ipp-attribute-
1337 fidelity" and its relationship to other attributes, especially the Printer object's "pdl-override-
1338 supported" attribute.

1339

1340 "document-name" (name(MAX)):

1341 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.
1342 It contains the client supplied document name. The document name MAY be different than the Job
1343 name. Typically, the client software automatically supplies the document name on behalf of the end
1344 user by using a file name or an application generated name. If this attribute is supplied, its value can
1345 be used in a manner defined by each implementation. Examples include: printed along with the Job
1346 (job start sheet, page adornments, etc.), used by accounting or resource tracking management tools,

1347 or even stored along with the document as a document level attribute. IPP/1.1 does not support the
1348 concept of document level attributes.

1349

1350 "compression" (type3 keyword)

1351 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute
1352 and the "compression-supported" attribute (see section 4.4.32). The client supplied "compression"
1353 operation attribute identifies the compression algorithm used on the document data. The following
1354 cases exist:

- 1355 a) If the client omits this attribute, the Printer object MUST assume that the data is not
1356 compressed (i.e. the Printer follows the rules below as if the client supplied the
1357 "compression" attribute with a value of 'none').
- 1358 b) If the client supplies this attribute, but the value is not supported by the Printer object,
1359 i.e., the value is not one of the values of the Printer object's "compression-supported"
1360 attribute, the Printer object MUST reject the request, and return the 'client-error-
1361 compression-not-supported' status code. See section 3.1.7 for returning unsupported
1362 attributes and values.
- 1363 c) If the client supplies the attribute and the Printer object supports the attribute value, the
1364 Printer object uses the corresponding decompression algorithm on the document data.
- 1365 d) If the decompression algorithm fails before the Printer returns an operation response, the
1366 Printer object MUST reject the request and return the 'client-error-compression-error'
1367 status code.
- 1368 e) If the decompression algorithm fails after the Printer returns an operation response, the
1369 Printer object MUST abort the job and add the 'compression-error' value to the job's
1370 "job-state-reasons" attribute.
- 1371 f) If the decompression algorithm succeeds, the document data MUST then have the format
1372 specified by the job's "document-format" attribute, if supplied (see "document-format"
1373 operation attribute definition below). **Issue 28**

1374

1375 "document-format" (mimeMediaType) :

1376 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.
1377 The value of this attribute identifies the format of the supplied document data. The following cases
1378 exist:

- 1379 a) If the client does not supply this attribute, the Printer object assumes that the document
1380 data is in the format defined by the Printer object's "document-format-default" attribute.
1381 (i.e. the Printer follows the rules below as if the client supplied the "document-format"
1382 attribute with a value equal to the printer's default value).
- 1383 b) If the client supplies this attribute, but the value is not supported by the Printer object,
1384 i.e., the value is not one of the values of the Printer object's "document-format-
1385 supported" attribute, the Printer object MUST reject the request and return the 'client-
1386 error-document-format-not-supported' status code.
- 1387 c) If the client supplies this attribute and its value is 'application/octet-stream' (i.e. to be
1388 auto-sensed, see Section 4.1.9.1), and the format is not one of the document-formats that
1389 the Printer can auto-sense, and this check occurs before the Printer returns an operation
1390 response, then the Printer MUST reject the request and return the 'client-error-
1391 document-format-not-supported' status code.

- 1392 d) If the client supplies this attribute, and the value is supported by the Printer object, the
1393 document data, the Printer is capable of interpreting the document data.
- 1394 e) If interpreting of the document data fails before the Printer returns an operation response,
1395 the Printer object MUST reject the request and return the 'client-error-document-format-
1396 error' status code.
- 1397 f) If interpreting of the document data fails after the Printer returns an operation response,
1398 the Printer object MUST abort the job and add the 'document-format-error' value to the
1399 job's "job-state-reasons" attribute. **Issue 11**

1400
1401 "document-natural-language" (naturalLanguage):

1402 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this
1403 attribute. This attribute specifies the natural language of the document for those document-formats
1404 that require a specification of the natural language in order to image the document unambiguously.
1405 There are no particular values required for the Printer object to support.

1406
1407
1408 "job-k-octets" (integer(0:MAX))

1409 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this
1410 attribute and the "job-k-octets-supported" attribute (see section 4.4.33). The client supplied "job-k-
1411 octets" operation attribute identifies the total size of the document(s) in K octets being submitted
1412 (see section 4.3.17.1 for the complete semantics). If the client supplies the attribute and the Printer
1413 object supports the attribute, the value of the attribute is used to populate the Job object's "job-k-
1414 octets" Job Description attribute.

1415
1416 For this attribute and the following two attributes ("job-impressions", and "job-media-sheets"), if the
1417 client supplies the attribute, but the Printer object does not support the attribute, the Printer object
1418 ignores the client-supplied value. If the client supplies the attribute and the Printer supports the
1419 attribute, and the value is within the range of the corresponding Printer object's "xxx-supported"
1420 attribute, the Printer object MUST use the value to populate the Job object's "xxx" attribute. If the
1421 client supplies the attribute and the Printer supports the attribute, but the value is outside the range
1422 of the corresponding Printer object's "xxx-supported" attribute, the Printer object MUST copy the
1423 attribute and its value to the Unsupported Attributes response group, reject the request, and return
1424 the 'client-error-attributes-or-values-not-supported' status code. If the client does not supply the
1425 attribute, the Printer object MAY choose to populate the corresponding Job object attribute
1426 depending on whether the Printer object supports the attribute and is able to calculate or discern the
1427 correct value.

1428
1429 "job-impressions" (integer(0:MAX))

1430 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this
1431 attribute and the "job-impressions-supported" attribute (see section 4.4.34). The client supplied
1432 "job-impressions" operation attribute identifies the total size in number of impressions of the
1433 document(s) being submitted (see section 4.3.17.2 for the complete semantics).

1434
1435 See last paragraph under "job-k-octets".

1436

1437 "job-media-sheets" (integer(0:MAX))
1438 The client **OPTIONALLY** supplies this attribute. The Printer object **OPTIONALLY** supports this
1439 attribute and the "job-media-sheets-supported" attribute (see section 4.4.35). The client supplied
1440 "job-media-sheets" operation attribute identifies the total number of media sheets to be produced for
1441 this job (see section 4.3.17.3 for the complete semantics).

1442
1443 See last paragraph under "job-k-octets".
1444

1445 Group 2: Job Template Attributes

1446 The client **OPTIONALLY** supplies a set of Job Template attributes as defined in section 4.2. If the
1447 client is not supplying any Job Template attributes in the request, the client **SHOULD** omit Group 2
1448 rather than sending an empty group. However, a Printer object **MUST** be able to accept an empty
1449 group.
1450

1451 Group 3: Document Content

1452 The client **MUST** supply the document data to be processed.
1453

1454 In addition to the **MANDATORY** parameters required for every operation request, the simplest Print-Job
1455 Request consists of just the "attributes-charset" and "attributes-natural-language" operation attributes; the
1456 "printer-uri" target operation attribute; the Document Content and nothing else. In this simple case, the
1457 Printer object:

- 1458 - creates a new Job object (the Job object contains a single document),
- 1459 - stores a generated Job name in the "job-name" attribute in the natural language and charset requested
1460 (see Section 3.1.4.1) (if those are supported, otherwise using the Printer object's default natural
1461 language and charset), and
- 1462 - at job processing time, uses its corresponding default value attributes for the supported Job Template
1463 attributes that were not supplied by the client as IPP attribute or embedded instructions in the
1464 document data.
1465

1466 3.2.1.2 Print-Job Response

1467 The Printer object **MUST** return to the client the following sets of attributes as part of the Print-Job
1468 Response:

1469 Group 1: Operation Attributes

1470 Status Message:

1471 In addition to the **REQUIRED** status code returned in every response, the response **OPTIONALLY**
1472 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6. If
1473 the client supplies unsupported or conflicting Job Template attributes or values, the Printer object
1474 **MUST** reject or accept the Print-Job request depending on the whether the client supplied a 'true' or

1475 'false' value for the "ipp-attribute-fidelity" operation attribute. See the Implementer's Guide [IPP-
1476 IIG] for a complete description of the suggested steps for processing a create request.

1477

1478 Natural Language and Character Set:

1479 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

1480

1481 Group 2: Unsupported Attributes

1482 See section 3.1.7 for details on returning Unsupported Attributes.

1483

1484 The value of the "ipp-attribute-fidelity" supplied by the client does not affect what attributes the
1485 Printer object returns in this group. The value of "ipp-attribute-fidelity" only affects whether the
1486 Print-Job operation is accepted or rejected. If the job is accepted, the client may query the job using
1487 the Get-Job-Attributes operation requesting the unsupported attributes that were returned in the
1488 create response to see which attributes were ignored (not stored on the Job object) and which
1489 attributes were stored with other (substituted) values.

1490

1491 Group 3: Job Object Attributes

1492 "job-uri" (uri):

1493 The Printer object MUST return the Job object's URI by returning the contents of the REQUIRED
1494 "job-uri" Job object attribute. The client uses the Job object's URI when directing operations at the
1495 Job object. The Printer object always uses its configured security policy when creating the new
1496 URI. However, if the Printer object supports more than one URI, the Printer object also uses
1497 information about which URI was used in the Print-Job Request to generated the new URI so that
1498 the new URI references the correct access channel. In other words, if the Print-Job Request comes
1499 in over a secure channel, the Printer object MUST generate a Job URI that uses the secure channel
1500 as well.

1501

1502 "job-id" (integer(1:MAX)):

1503 The Printer object MUST return the Job object's Job ID by returning the REQUIRED "job-id" Job
1504 object attribute. The client uses this "job-id" attribute in conjunction with the "printer-uri" attribute
1505 used in the Print-Job Request when directing Job operations at the Printer object.

1506

1507 "job-state":

1508 The Printer object MUST return the Job object's REQUIRED "job-state" attribute. The value of this
1509 attribute (along with the value of the next attribute: "job-state-reasons") is taken from a "snapshot"
1510 of the new Job object at some meaningful point in time (implementation defined) between when the
1511 Printer object receives the Print-Job Request and when the Printer object returns the response.

1512

1513 "job-state-reasons":

1514 The Printer object MUST return the Job object's REQUIRED "job-state-reasons" attribute. . Issue

1515 30

1516

1517 "job-state-message":
1518 The Printer object **OPTIONALLY** returns the Job object's **OPTIONAL** "job-state-message"
1519 attribute. If the Printer object supports this attribute then it **MUST** be returned in the response. If
1520 this attribute is not returned in the response, the client can assume that the "job-state-message"
1521 attribute is not supported and will not be returned in a subsequent Job object query.

1522
1523 "number-of-intervening-jobs":
1524 The Printer object **OPTIONALLY** returns the Job object's **OPTIONAL** "number-of-intervening-
1525 jobs" attribute. If the Printer object supports this attribute then it **MUST** be returned in the response.
1526 If this attribute is not returned in the response, the client can assume that the "number-of-
1527 intervening-jobs" attribute is not supported and will not be returned in a subsequent Job object
1528 query.

1529
1530 Note: Since any printer state information which affects a job's state is reflected in the "job-state" and
1531 "job-state-reasons" attributes, it is sufficient to return only these attributes and no specific printer
1532 status attributes.

1533

1534 Note: In addition to the **MANDATORY** parameters required for every operation response, the simplest
1535 response consists of the just the "attributes-charset" and "attributes-natural-language" operation attributes
1536 and the "job-uri", "job-id", and "job-state" Job Object Attributes. In this simplest case, the status code is
1537 'successful-ok' and there is no "status-message" operation attribute.

1538 3.2.2 Print-URI Operation

1539 This **OPTIONAL** operation is identical to the Print-Job operation (section 3.2.1) except that a client
1540 supplies a URI reference to the document data using the "document-uri" (uri) operation attribute (in Group
1541 1) rather than including the document data itself. Before returning the response, the Printer **MUST** validate
1542 that the Printer supports the retrieval method (e.g., http, ftp, etc.) implied by the URI, and **MUST** check for
1543 valid URI syntax. If the client-supplied URI scheme is not supported, i.e. the value is not in the Printer
1544 object's "referenced-uri-scheme-supported" attribute, the Printer object **MUST** reject the request and return
1545 the 'client-error-uri-scheme-not-supported' status code.

1546 The IPP Printer **MAY** validate the accessibility of the document as part of the operation or subsequently. If
1547 the Printer determines an accessibility problem before returning an operation response, it rejects the request
1548 and returns the 'client-error-document-access-error' status code. The Printer **MAY** also return a specific
1549 document access error code using the "document-access-error" operation attribute (see section 3.1.6.4).

1550 **Issue 35**

1551 If the Printer determines this document accessibility problem after accepting the request and returning an
1552 operation response with one of the successful status codes, the Printer adds the 'document-access-error'
1553 value to the job's "job-state-reasons" attribute and **MAY** populate the job's "job-document-access-errors"
1554 Job Description attribute (see section 4.3.11). See The Implementer's Guide [IPP-IIG] for suggested
1555 additional checks. **Issue 35**

1556 If the Printer object supports this operation, it MUST support the "reference-uri-schemes-supported" Printer
1557 attribute (see section 4.4.27).

1558 It is up to the IPP object to interpret the URI and subsequently "pull" the document from the source
1559 referenced by the URI string.

1560 3.2.3 Validate-Job Operation

1561 This REQUIRED operation is similar to the Print-Job operation (section 3.2.1) except that a client supplies
1562 no document data and the Printer allocates no resources (i.e., it does not create a new Job object). This
1563 operation is used only to verify capabilities of a printer object against whatever attributes are supplied by
1564 the client in the Validate-Job request. By using the Validate-Job operation a client can validate that an
1565 identical Print-Job operation (with the document data) would be accepted. The Validate-Job operation also
1566 performs the same security negotiation as the Print-Job operation (see section 8), so that a client can check
1567 that the client and Printer object security requirements can be met before performing a Print-Job operation.

1568 The Validate-Job operation does not accept a "document-uri" attribute in order to allow a client to check
1569 that the same Print-URI operation will be accepted, since the client doesn't send the data with the Print-URI
1570 operation. The client SHOULD just issue the Print-URI request.

1571 The Printer object returns the same status codes, Operation Attributes (Group 1) and Unsupported
1572 Attributes (Group 2) as the Print-Job operation. However, no Job Object Attributes (Group 3) are returned,
1573 since no Job object is created.

1574 3.2.4 Create-Job Operation

1575 This OPTIONAL operation is similar to the Print-Job operation (section 3.2.1) except that in the Create-Job
1576 request, a client does not supply document data or any reference to document data. Also, the client does not
1577 supply any of the "document-name", "document-format", "compression", or "document-natural-language"
1578 operation attributes. This operation is followed by one or more Send-Document or Send-URI operations.
1579 In each of those operation requests, the client OPTIONALLY supplies the "document-name", "document-
1580 format", and "document-natural-language" attributes for each document in the multi-document Job object.

1581 If a Printer object supports the Create-Job operation, it MUST also support the Send-Document operation
1582 and also MAY support the Send-URI operation.

1583 If the Printer object supports this operation, it MUST support the "multiple-operation-time-out" Printer
1584 attribute (see section 4.4.31).

1585 If the Printer object supports this operation, then it MUST support the "multiple-document-jobs-supported"
1586 Printer Description attribute (see section 4.4.16) and indicate whether or not it supports multiple-document
1587 jobs. **Issue 34**

1588 If the Printer object supports this operation and supports multiple documents in a job, then it MUST support
1589 the "multiple-document-handling" Job Template job attribute with at least one value (see section 4.2.4) and

1590 the associated "multiple-document-handling-default" and "multiple-document-handling-supported" Job
1591 Template Printer attributes (see section 4.2). **Issue 34**

1592 After the Create-Job operation has completed, the value of the "job-state" attribute is similar to the "job-
1593 state" after a Print-Job, even though no document-data has arrived. A Printer MAY set the 'job-data-
1594 insufficient' value of the job's "job-state-reason" attribute to indicate that processing cannot begin until
1595 sufficient data has arrived and set the "job-state" to either 'pending' or 'pending-held'. A non-spooling
1596 printer that doesn't implement the 'pending' job state may even set the "job-state" to 'processing', even
1597 though there is not yet any data to process. See sections 4.3.7 and 4.3.8. **Issue 13**

1598 3.2.5 Get-Printer-Attributes Operation

1599 This REQUIRED operation allows a client to request the values of the attributes of a Printer object. In the
1600 request, the client supplies the set of Printer attribute names and/or attribute group names in which the
1601 requester is interested. In the response, the Printer object returns a corresponding attribute set with the
1602 appropriate attribute values filled in.

1603 For Printer objects, the possible names of attribute groups are:

- 1604 - 'job-template': the subset of the Job Template attributes that apply to a Printer object (the last two
1605 columns of the table in Section 4.2) that the implementation supports for Printer objects.
- 1606 - 'printer-description': the subset of the attributes specified in Section 4.4 that the implementation
1607 supports for Printer objects.
- 1608 - 'all': the special group 'all' that includes all attributes that the implementation supports for Printer
1609 objects. **Issue 23**

1610
1611 Since a client MAY request specific attributes or named groups, there is a potential that there is some
1612 overlap. For example, if a client requests, 'printer-name' and 'all', the client is actually requesting the
1613 "printer-name" attribute twice: once by naming it explicitly, and once by inclusion in the 'all' group. In such
1614 cases, the Printer object NEED NOT return each attribute only once in the response even if it is requested
1615 multiple times. The client SHOULD NOT request the same attribute in multiple ways.

1616 It is NOT REQUIRED that a Printer object support all attributes belonging to a group (since some attributes
1617 are OPTIONAL). However, it is REQUIRED that each Printer object support all group names.

1618 3.2.5.1 Get-Printer-Attributes Request

1619 The following sets of attributes are part of the Get-Printer-Attributes Request:

1620 Group 1: Operation Attributes

1621 Natural Language and Character Set:

1622 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1623

1624
1625
1626
1627
1628
1629
1630
1631
1632
1633
1634
1635
1636
1637
1638
1639
1640
1641
1642
1643
1644
1645
1646
1647
1648
1649
1650
1651
1652
1653
1654
1655
1656
1657
1658
1659
1660
1661
1662
1663
1664
1665
1666
1667
1668

Target:

The "printer-uri" (uri) operation attribute which is the target for this operation as described in section 3.1.5.

Requesting User Name:

The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as described in section 8.3.

"requested-attributes" (1setOf keyword) :

The client OPTIONALLY supplies a set of attribute names and/or attribute group names in whose values the requester is interested. The Printer object MUST support this attribute. If the client omits this attribute, the Printer MUST respond as if this attribute had been supplied with a value of 'all'.

"document-format" (mimeMediaType) :

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. This attribute is useful for a Printer object to determine the set of supported attribute values that relate to the requested document format. The Printer object MUST return the attributes and values that it uses to validate a job on a create or Validate-Job operation in which this document format is supplied. The Printer object SHOULD return only (1) those attributes that are supported for the specified format and (2) the attribute values that are supported for the specified document format. By specifying the document format, the client can get the Printer object to eliminate the attributes and values that are not supported for a specific document format. For example, a Printer object might have multiple interpreters to support both 'application/postscript' (for PostScript) and 'text/plain' (for text) documents. However, for only one of those interpreters might the Printer object be able to support "number-up" with values of '1', '2', and '4'. For the other interpreter it might be able to only support "number-up" with a value of '1'. Thus a client can use the Get-Printer-Attributes operation to obtain the attributes and values that will be used to accept/reject a create job operation.

If the Printer object does not distinguish between different sets of supported values for each different document format when validating jobs in the create and Validate-Job operations, it MUST NOT distinguish between different document formats in the Get-Printer-Attributes operation. If the Printer object does distinguish between different sets of supported values for each different document format specified by the client, this specialization applies only to the following Printer object attributes:

- Printer attributes that are Job Template attributes ("xxx-default" "xxx-supported", and "xxx-ready" in the Table in Section 4.2),
- "pdl-override-supported",
- "compression-supported",
- "job-k-octets-supported",
- "job-impressions-supported",
- "job-media-sheets-supported"
- "printer-driver-installer",

- 1669 - "color-supported", and
1670 - "reference-uri-schemes-supported"

1671

1672 The values of all other Printer object attributes (including "document-format-supported") remain
1673 invariant with respect to the client supplied document format (except for new Printer description
1674 attribute as registered according to section 6.2).

1675

1676 If the client omits this "document-format" operation attribute, the Printer object MUST respond as if
1677 the attribute had been supplied with the value of the Printer object's "document-format-default"
1678 attribute. It is recommended that the client always supply a value for "document-format", since the
1679 Printer object's "document-format-default" may be 'application/octet-stream', in which case the
1680 returned attributes and values are for the union of the document formats that the Printer can
1681 automatically sense. For more details, see the description of the 'mimeType' attribute syntax
1682 in section 4.1.9.

1683

1684 If the client supplies a value for the "document-format" Operation attribute that is not supported by
1685 the Printer, i.e., is not among the values of the Printer object's "document-format-supported"
1686 attribute, the Printer object MUST reject the operation and return the 'client-error-document-format-
1687 not-supported' status code.

1688

1689 3.2.5.2 Get-Printer-Attributes Response

1690 The Printer object returns the following sets of attributes as part of the Get-Printer-Attributes Response:

1691 Group 1: Operation Attributes

1692 Status Message:

1693 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY
1694 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

1695

1696 Natural Language and Character Set:

1697 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

1698

1699 Group 2: Unsupported Attributes

1700 See section 3.1.7 for details on returning Unsupported Attributes.

1701

1702 The response NEED NOT contain the "requested-attributes" operation attribute with any supplied
1703 values (attribute keywords) that were requested by the client but are not supported by the IPP object.
1704 If the Printer object does include unsupported attributes referenced in "requested-attributes" and
1705 such attributes include group names, such as 'all', the unsupported attributes MUST NOT include
1706 attributes described in the standard but not supported by the implementation. **Issue 23**

1707

1708 Group 3: Printer Object Attributes

1709 This is the set of requested attributes and their current values. The Printer object ignores (does not
1710 respond with) any requested attribute which is not supported. The Printer object MAY respond with
1711 a subset of the supported attributes and values, depending on the security policy in force. However,
1712 the Printer object MUST respond with the 'unknown' value for any supported attribute (including all
1713 REQUIRED attributes) for which the Printer object does not know the value. Also the Printer
1714 object MUST respond with the 'no-value' for any supported attribute (including all REQUIRED
1715 attributes) for which the system administrator has not configured a value. See the description of the
1716 "out-of-band" values in the beginning of Section 4.1.
1717

1718 3.2.6 Get-Jobs Operation

1719 This REQUIRED operation allows a client to retrieve the list of Job objects belonging to the target Printer
1720 object. The client may also supply a list of Job attribute names and/or attribute group names. A group of
1721 Job object attributes will be returned for each Job object that is returned.

1722 This operation is similar to the Get-Job-Attributes operation, except that this Get-Jobs operation returns
1723 attributes from possibly more than one object (see the description of Job attribute group names in section
1724 3.3.4).

1725 3.2.6.1 Get-Jobs Request

1726 The client submits the Get-Jobs request to a Printer object.

1727 The following groups of attributes are part of the Get-Jobs Request:

1728 Group 1: Operation Attributes

1729 Natural Language and Character Set:

1730 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.
1731

1732 Target:

1733 The "printer-uri" (uri) operation attribute which is the target for this operation as described in
1734 section 3.1.5.
1735

1736 Requesting User Name:

1737 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
1738 described in section 8.3.
1739

1740 "limit" (integer(1:MAX)):

1741 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It
1742 is an integer value that determines the maximum number of jobs that a client will receive from the
1743 Printer even if "which-jobs" or "my-jobs" constrain which jobs are returned. The limit is a "stateless
1744 limit" in that if the value supplied by the client is 'N', then only the first 'N' jobs are returned in the
1745 Get-Jobs Response. There is no mechanism to allow for the next 'M' jobs after the first 'N' jobs. If
1746 the client does not supply this attribute, the Printer object responds with all applicable jobs. **Issue 8**

1747

"requested-attributes" (1setOf keyword):

1748

1749

1750

1751

1752

1753

1754

1755

"which-jobs" (keyword):

1756

1757

1758

1759

1760

'completed': This includes any Job object whose state is 'completed', 'canceled', or 'aborted'.

1761

1762

1763

1764

'not-completed': This includes any Job object whose state is 'pending', 'processing', 'processing-stopped', or 'pending-held'.

1765

1766

1767

1768

A Printer object MUST support both values. However, if the implementation does not keep jobs in the 'completed', 'canceled', and 'aborted' states, then it returns no jobs when the 'completed' value is supplied.

1769

1770

1771

1772

If a client supplies some other value, the Printer object MUST copy the attribute and the unsupported value to the Unsupported Attributes response group, reject the request, and return the 'client-error-attributes-or-values-not-supported' status code.

1773

1774

1775

If the client does not supply this attribute, the Printer object MUST respond as if the client had supplied the attribute with a value of 'not-completed'.

1776

"my-jobs" (boolean):

1777

1778

1779

1780

1781

1782

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It indicates whether jobs from all users or just the jobs submitted by the requesting user of this request MUST be returned by the Printer object. If the client does not supply this attribute, the Printer object MUST respond as if the client had supplied the attribute with a value of 'false', i.e., jobs from all users. The means for authenticating the requesting user and matching the jobs is described in section 8.

1783

3.2.6.2 Get-Jobs Response

1784

1785

1786

1787

1788

The Printer object returns all of the Job objects up to the number specified by the "limit" attribute that match the criteria as defined by the attribute values supplied by the client in the request. It is possible that no Job objects are returned since there may literally be no Job objects at the Printer, or there may be no Job objects that match the criteria supplied by the client. If the client requests any Job attributes at all, there is a set of Job Object Attributes returned for each Job object.

1789 It is not an error for the Printer to return 0 jobs. If the response returns 0 jobs because there are no jobs
1790 matching the criteria, and the request would have returned 1 or more jobs with a status code of 'successful-
1791 ok' if there had been jobs matching the criteria, then the status code for 0 jobs MUST be 'successful-ok'.
1792

Issue 24

1793 Group 1: Operation Attributes

Status Message:

1794 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY
1795 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.
1796

Natural Language and Character Set:

1797 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.
1798
1799
1800

1801 Group 2: Unsupported Attributes

1802 See section 3.1.7 for details on returning Unsupported Attributes.
1803

1804 The response NEED NOT contain the "requested-attributes" operation attribute with any supplied
1805 values (attribute keywords) that were requested by the client but are not supported by the IPP object.
1806 If the Printer object does include unsupported attributes referenced in "requested-attributes" and
1807 such attributes include group names, such as 'all', the unsupported attributes MUST NOT include
1808 attributes described in the standard but not supported by the implementation. Issue 23
1809

1810 Groups 3 to N: Job Object Attributes

1811 The Printer object responds with one set of Job Object Attributes for each returned Job object. The
1812 Printer object ignores (does not respond with) any requested attribute or value which is not
1813 supported or which is restricted by the security policy in force, including whether the requesting
1814 user is the user that submitted the job (job originating user) or not (see section 8). However, the
1815 Printer object MUST respond with the 'unknown' value for any supported attribute (including all
1816 REQUIRED attributes) for which the Printer object does not know the value, unless it would violate
1817 the security policy. See the description of the "out-of-band" values in the beginning of Section 4.1.
1818

1819 Jobs are returned in the following order:

- 1820 - If the client requests all 'completed' Jobs (Jobs in the 'completed', 'aborted', or 'canceled' states),
1821 then the Jobs are returned newest to oldest (with respect to actual completion time)
- 1822 - If the client requests all 'not-completed' Jobs (Jobs in the 'pending', 'processing', 'pending-held',
1823 and 'processing-stopped' states), then Jobs are returned in relative chronological order of
1824 expected time to complete (based on whatever scheduling algorithm is configured for the
1825 Printer object).

1826 3.2.7 Pause-Printer Operation

1827 This OPTIONAL operation allows a client to stop the Printer object from scheduling jobs on all its devices.
1828 Depending on implementation, the Pause-Printer operation MAY also stop the Printer from processing the

1829 current job or jobs. Any job that is currently being printed is either stopped as soon as the implementation
 1830 permits or is completed, depending on implementation. The Printer object **MUST** still accept create
 1831 operations to create new jobs, but **MUST** prevent any jobs from entering the 'processing' state.

1832 If the Pause-Printer operation is supported, then the Resume-Printer operation **MUST** be supported, and
 1833 vice-versa.

1834 The IPP Printer stops the current job(s) on its device(s) that were in the 'processing' or 'processing-stopped'
 1835 states as soon as the implementation permits. If the implementation **Issue 30** will take appreciable time to
 1836 stop, the IPP Printer adds the 'moving-to-paused' value to the Printer object's "printer-state-reasons"
 1837 attribute (see section 4.4.12). When the device(s) have all stopped, the IPP Printer transitions the Printer
 1838 object to the 'stopped' state, removes the 'moving-to-paused' value, if present, and adds the 'paused' value to
 1839 the Printer object's "printer-state-reasons" attribute.

1840 When the current job(s) complete that were in the 'processing' state, the IPP Printer transitions them to the
 1841 'completed' state. When the current job(s) stop in mid processing that were in the 'processing' state, the IPP
 1842 Printer transitions them to the 'processing-stopped' state and **Issue 30** adds the 'printer-stopped' value to the
 1843 job's "job-state-reasons" attribute.

1844 For any jobs that are 'pending' or 'pending-held', the 'printer-stopped' value of the jobs' "job-state-reasons"
 1845 attribute also applies. However, the IPP Printer **NEED NOT** update those jobs' "job-state-reasons"
 1846 attributes and only need return the 'printer-stopped' value when those jobs are queried (so-called "lazy
 1847 evaluation").

1848 Whether the Pause-Printer operation affects jobs that were submitted to the device from other sources than
 1849 the IPP Printer object in the same way that the Pause-Printer operation affects jobs that were submitted to
 1850 the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP protocol is being used
 1851 as a universal management protocol or just to manage IPP jobs, respectively.

1852 The IPP Printer **MUST** accept the request in any state and transition the Printer to the indicated new
 1853 "printer-state" before returning as follows:

Current "printer-state"	New "printer-state"	"printer- state- reasons"	IPP Printer's response status code and action:
'idle'	'stopped'	'paused'	'successful-ok'
'processing'	'processing'	'moving-to- paused'	OPTION 1: 'successful-ok'; Later, when all output has stopped, the "printer- state" becomes 'stopped', and the 'paused' value replaces the 'moving-to-paused' value in the "printer-state-reasons" attribute
'processing'	'stopped'	'paused'	OPTION 2: 'successful-ok'; all device output stopped immediately
'stopped'	'stopped'	'paused'	'successful-ok'

1854 *Access Rights:* The authenticated user (see section 8.3) performing this operation must be an operator or
1855 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer **MUST** reject the
1856 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized'
1857 as appropriate.

1858 3.2.7.1 Pause-Printer Request

1859 The following groups of attributes are part of the Pause-Printer Request:

1860 Group 1: Operation Attributes

1861 Natural Language and Character Set:

1862 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1863

1864 Target:

1865 The "printer-uri" (uri) operation attribute which is the target for this operation as described in
1866 section 3.1.5.

1867

1868 Requesting User Name:

1869 The "requesting-user-name" (name(MAX)) attribute **SHOULD** be supplied by the client as
1870 described in section 8.3.

1871 3.2.7.2 Pause-Printer Response

1872 The following groups of attributes are part of the Pause-Printer Response:

1873 Group 1: Operation Attributes

1874 Status Message:

1875 In addition to the **REQUIRED** status code returned in every response, the response **OPTIONALLY**
1876 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

1877

1878 Natural Language and Character Set:

1879 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

1880

1881 Group 2: Unsupported Attributes

1882 See section 3.1.7 for details on returning Unsupported Attributes.

1883

1884 3.2.8 Resume-Printer Operation

1885 This operation allows a client to resume the Printer object scheduling jobs on all its devices. The Printer
1886 object **Issue 30** **MUST** remove the 'paused' and 'moving-to-paused' values from the Printer object's
1887 "printer-state-reasons" attribute, if present. If there are no other reasons to keep a device paused (such as
1888 media-jam), the IPP Printer transitions itself to the 'processing' or 'idle' states, depending on whether there
1889 are jobs to be processed or not, respectively, and the device(s) resume processing jobs.

1890 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and
 1891 vice-versa.

1892 The IPP Printer removes the 'printer-stopped' value from any job's "job-state-reasons" attributes contained
 1893 in that Printer.

1894 The IPP Printer MUST accept the request in any state, transition the Printer object to the indicated new state
 1895 as follows:

Current "printer-state"	New "printer-state"	IPP Printer's response status code and action:
'idle'	'idle'	'successful-ok'
'processing'	'processing'	'successful-ok'
'stopped'	'processing'	'successful-ok'; when there are jobs to be processed
'stopped'	'idle'	'successful-ok'; when there are no jobs to be processed.

1896 *Access Rights:* The authenticated user (see section 8.3) performing this operation must be an operator or
 1897 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer MUST reject the
 1898 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized'
 1899 as appropriate.

1900 The Resume-Printer Request and Resume-Printer Response have the same attribute groups and attributes as
 1901 the Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1902 3.2.9 Purge-Jobs Operation

1903 This OPTIONAL operation allows a client to remove all jobs from an IPP Printer object, regardless of their
 1904 job states, including jobs in the Printer object's Job History (see Section 4.3.7.2). After a Purge-Jobs
 1905 operation has been performed, a Printer object MUST return no jobs in subsequent Get-Job-Attributes and
 1906 Get-Jobs responses (until new jobs are submitted).

1907 Whether the Purge-Jobs (and Get-Jobs) operation affects jobs that were submitted to the device from other
 1908 sources than the IPP Printer object in the same way that the Purge-Jobs operation affects jobs that were
 1909 submitted to the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP protocol
 1910 is being used as a universal management protocol or just to manage IPP jobs, respectively.

1911 Note: if an operator wants to cancel all jobs without clearing out the Job History, the operator uses the
 1912 Cancel-Job operation on each job instead of using the Purge-Job operation.

1913 The Printer object MUST accept this operation in any state and transition the Printer object to the 'idle'
 1914 state.

1915 *Access Rights:* The authenticated user (see section 8.3) performing this operation must be an operator or
 1916 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP object MUST reject the

1917 operation and return: client-error-forbidden, client-error-not-authenticated, and client-error-not-authorized
1918 as appropriate.

1919 The Purge-Jobs Request and Purge-Jobs Response have the same attribute groups and attributes as the
1920 Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1921

1922 3.3 Job Operations

1923 All Job operations are directed at Job objects. A client **MUST** always supply some means of identifying the
1924 Job object in order to identify the correct target of the operation. That job identification **MAY** either be a
1925 single Job URI or a combination of a Printer URI with a Job ID. The IPP object implementation **MUST**
1926 support both forms of identification for every job.

1927 3.3.1 Send-Document Operation

1928 This **OPTIONAL** operation allows a client to create a multi-document Job object that is initially "empty"
1929 (contains no documents). In the Create-Job response, the Printer object returns the Job object's URI (the
1930 "job-uri" attribute) and the Job object's 32-bit identifier (the "job-id" attribute). For each new document
1931 that the client desires to add, the client uses a Send-Document operation. Each Send-Document Request
1932 contains the entire stream of document data for one document.

1933 If the Printer supports this operation but does not support multiple documents per job, the Printer **MUST**
1934 reject subsequent Send-Document operations supplied with data and return the 'server-error-multiple-
1935 document-jobs-not-supported'. However, the Printer **MUST** accept the first document with a 'true' or 'false'
1936 value for the "last-document" operation attribute (see below), so that clients **MAY** always submit one
1937 document jobs with a 'false' value for "last-document" in the first Send-Document and a 'true' for "last-
1938 document" in the second Send-Document (with no data). **Issue 34**

1939 Since the Create-Job and the send operations (Send-Document or Send-URI operations) that follow could
1940 occur over an arbitrarily long period of time for a particular job, a client **MUST** send another send operation
1941 within an IPP Printer defined minimum time interval after the receipt of the previous request for the job. If
1942 a Printer object supports multiple document jobs, the Printer object **MUST** support the "multiple-operation-
1943 time-out" attribute (see section 4.4.31). This attribute indicates the minimum number of seconds the Printer
1944 object will wait for the next send operation before taking some recovery action.

1945 An IPP object **MUST** recover from an errant client that does not supply a send operation, sometime after
1946 the minimum time interval specified by the Printer object's "multiple-operation-time-out" attribute. Such
1947 recovery **MAY** include any of the following or other recovery actions:

1948 1. Assume that the Job is an invalid job, start the process of changing the job state to 'aborted', add the
1949 'aborted-by-system' value to the job's "job-state-reasons" attribute (see section 4.3.8), **Issue 30** and
1950 clean up all resources associated with the Job. In this case, if another send operation is finally
1951 received, the Printer responds with an "client-error-not-possible" or "client-error-not-found"
1952 depending on whether or not the Job object is still around when the send operation finally arrives.

- 1953 2. Assume that the last send operation received was in fact the last document (as if the "last-document"
1954 flag had been set to 'true'), close the Job object, and proceed to process it (i.e., move the Job's state
1955 to 'pending').
- 1956 3. Assume that the last send operation received was in fact the last document, close the Job, but move it
1957 to the 'pending-held' and add the 'submission-interrupted' value to the job's "job-state-reasons"
1958 attribute (see section 4.3.8). **Issue 30** This action allows the user or an operator to determine
1959 whether to continue processing the Job by moving it back to the 'pending' state using the Release-
1960 Job operation (see section 3.3.6) or to cancel the job using the Cancel-Job operation (see section
1961 3.3.3).
- 1962

1963 Each implementation is free to decide the "best" action to take depending on local policy, whether any
1964 documents have been added, whether the implementation spools jobs or not, and/or any other piece of
1965 information available to it. If the choice is to abort the Job object, it is possible that the Job object may
1966 already have been processed to the point that some media sheet pages have been printed.

1967 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
1968 owner (as determined in the Create-Job operation) or an operator or administrator of the Printer object (see
1969 Sections 1 and 8.5). Otherwise, the IPP object MUST reject the operation and return: 'client-error-
1970 forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized' as appropriate. **Issue 19**

1971 3.3.1.1 Send-Document Request

1972 The following attribute sets are part of the Send-Document Request:

1973 Group 1: Operation Attributes

1974 Natural Language and Character Set:

1975 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1976

1977 Target:

1978 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation
1979 attribute(s) which define the target for this operation as described in section 3.1.5.

1980

1981 Requesting User Name:

1982 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
1983 described in section 8.3.

1984

1985 "document-name" (name(MAX)):

1986 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It
1987 contains the client supplied document name. The document name MAY be different than the Job
1988 name. It might be helpful, but NEED NOT be unique across multiple documents in the same Job.
1989 Typically, the client software automatically supplies the document name on behalf of the end user
1990 by using a file name or an application generated name. See the description of the "document-name"
1991 operation attribute in the Print-Job Request (section 3.2.1.1) for more information about this
1992 attribute.

1993

1994 "compression" (type3 keyword)
1995 See the description of "compression" for the Print-Job operation in Section 3.2.1.1.
1996
1997 "document-format" (mimeMediaType) :
1998 See the description of "document-format" for the Print-Job operation in Section 3.2.1.1. **Issue 11**
1999
2000 "document-natural-language" (naturalLanguage):
2001 The client **OPTIONALLY** supplies this attribute. The Printer object **OPTIONALLY** supports this
2002 attribute. This attribute specifies the natural language of the document for those document-formats
2003 that require a specification of the natural language in order to image the document unambiguously.
2004 There are no particular values required for the Printer object to support.
2005
2006
2007 "last-document" (boolean):
2008 The client **MUST** supply this attribute. The Printer object **MUST** support this attribute. It is a
2009 boolean flag that is set to 'true' if this is the last document for the Job, 'false' otherwise.
2010

2011 Group 2: Document Content

2012 The client **MUST** supply the document data if the "last-document" flag is set to 'false'. However,
2013 since a client might not know that the previous document sent with a Send-Document (or Send-
2014 URI) operation was the last document (i.e., the "last-document" attribute was set to 'false'), it is legal
2015 to send a Send-Document request with no document data where the "last-document" flag is set to
2016 'true'. Such a request **MUST NOT** increment the value of the Job object's "number-of-documents"
2017 attribute, since no real document was added to the job.

2018 3.3.1.2 Send-Document Response

2019 The following sets of attributes are part of the Send-Document Response:

2020 Group 1: Operation Attributes

2021 Status Message:

2022 In addition to the **REQUIRED** status code returned in every response, the response **OPTIONALLY**
2023 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.
2024

2025 Natural Language and Character Set:

2026 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.
2027

2028 Group 2: Unsupported Attributes

2029 See section 3.1.7 for details on returning Unsupported Attributes.

2030 Group 3: Job Object Attributes

2031 This is the same set of attributes as described in the Print-Job response (see section 3.2.1.2).
2032

2033 3.3.2 Send-URI Operation

2034 This OPTIONAL operation is identical to the Send-Document operation (see section 3.3.1) except that a
 2035 client MUST supply a URI reference ("document-uri" operation attribute) rather than the document data
 2036 itself. If a Printer object supports this operation, clients can use both Send-URI or Send-Document
 2037 operations to add new documents to an existing multi-document Job object. However, if a client needs to
 2038 indicate that the previous Send-URI or Send-Document was the last document, the client MUST use the
 2039 Send-Document operation with no document data and the "last-document" flag set to 'true' (rather than
 2040 using a Send-URI operation with no "document-uri" operation attribute).

2041 If a Printer object supports this operation, it MUST also support the Print-URI operation (see section 3.2.2).

2042 The Printer object MUST validate the syntax and URI scheme of the supplied URI before returning a
 2043 response, just as in the Print-URI operation. The IPP Printer MAY validate the accessibility of the
 2044 document as part of the operation or subsequently (see section 3.2.2). **Issue 35**

2045 3.3.3 Cancel-Job Operation

2046 This REQUIRED operation allows a client to cancel a Print Job from the time the job is created up to the
 2047 time it is completed, canceled, or aborted. Since a Job might already be printing by the time a Cancel-Job is
 2048 received, some media sheet pages might be printed before the job is actually terminated.

2049 The IPP object MUST accept or reject the request based on the job's current state and transition the job to
 2050 the indicated new state as follows:

Current "job-state"	New "job-state"	IPP object's response status code and action:
'pending'	'canceled'	'successful-ok'
'pending-held'	'canceled'	'successful-ok'
'processing'	'canceled'	'successful-ok'
'processing'	'processing'	'successful-ok' See Rule 1
'processing'	'processing'	'client-error-not-possible' See Rule 2
'processing-stopped'	'canceled'	'successful-ok'
'processing-stopped'	'processing-stopped'	'successful-ok' See Rule 1
'processing-stopped'	'processing-stopped'	'client-error-not-possible' See Rule 2
'completed'	'completed'	'client-error-not-possible'
'canceled'	'canceled'	'client-error-not-possible'
'aborted'	'aborted'	'client-error-not-possible'

2051 Rule 1: If the implementation requires some measurable time to cancel the job in the 'processing' or
 2052 'processing-stopped' job states, the IPP object MUST add the 'processing-to-stop-point' value to the job's
 2053 "job-state-reasons" attribute and then transition the job to the 'canceled' state when the processing ceases
 2054 (see section 4.3.8).

2055 Rule 2: If the Job object already has the 'processing-to-stop-point' value in its "job-state-reasons" attribute,
 2056 then the Printer object MUST reject a Cancel-Job operation.

2057 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
2058 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP
2059 object **MUST** reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or
2060 'client-error-not-authorized' as appropriate.

2061 3.3.3.1 Cancel-Job Request

2062 The following groups of attributes are part of the Cancel-Job Request:

2063 Group 1: Operation Attributes

2064 Natural Language and Character Set:

2065 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2066

2067 Target:

2068 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation
2069 attribute(s) which define the target for this operation as described in section 3.1.5.

2070

2071 Requesting User Name:

2072 The "requesting-user-name" (name(MAX)) attribute **SHOULD** be supplied by the client as
2073 described in section 8.3.

2074

2075 "message" (text(127)):

2076 The client **OPTIONALLY** supplies this attribute. The Printer object **OPTIONALLY** supports this
2077 attribute. It is a message to the operator. This "message" attribute is not the same as the "job-
2078 message-from-operator" attribute. That attribute is used to report a message from the operator to the
2079 end user that queries that attribute. This "message" operation attribute is used to send a message
2080 from the client to the operator along with the operation request. It is an implementation decision of
2081 how or where to display this message to the operator (if at all).

2082

2083 3.3.3.2 Cancel-Job Response

2084 The following sets of attributes are part of the Cancel-Job Response:

2085 Group 1: Operation Attributes

2086 Status Message:

2087 In addition to the **REQUIRED** status code returned in every response, the response **OPTIONALLY**
2088 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

2089

2090 Natural Language and Character Set:

2091 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

2092

2093 Group 2: Unsupported Attributes

2094 See section 3.1.7 for details on returning Unsupported Attributes.

2095

2096 Once a successful response has been sent, the implementation guarantees that the Job will eventually end up
2097 in the 'canceled' state. Between the time of the Cancel-Job operation is accepted and when the job enters the
2098 'canceled' job-state (see section 4.3.7), the "job-state-reasons" attribute SHOULD contain the 'processing-to-
2099 stop-point' value which indicates to later queries that although the Job might still be 'processing', it will
2100 eventually end up in the 'canceled' state, not the 'completed' state.

2101 3.3.4 Get-Job-Attributes Operation

2102 This REQUIRED operation allows a client to request the values of attributes of a Job object and it is almost
2103 identical to the Get-Printer-Attributes operation (see section 3.2.5). The only differences are that the
2104 operation is directed at a Job object rather than a Printer object, there is no "document-format" operation
2105 attribute used when querying a Job object, and the returned attribute group is a set of Job object attributes
2106 rather than a set of Printer object attributes.

2107 For Jobs, the possible names of attribute groups are:

- 2108 - 'job-template': the subset of the Job Template attributes that apply to a Job object (the first column of
2109 the table in Section 4.2) that the implementation supports for Job objects.
- 2110 - 'job-description': the subset of the Job Description attributes specified in Section 4.3 that the
2111 implementation supports for Job objects.
- 2112 - 'all': the special group 'all' that includes all attributes that the implementation supports for Job objects.

2113 **Issue 23**

2114

2115 Since a client MAY request specific attributes or named groups, there is a potential that there is some
2116 overlap. For example, if a client requests, 'job-name' and 'job-description', the client is actually requesting
2117 the "job-name" attribute once by naming it explicitly, and once by inclusion in the 'job-description' group.
2118 In such cases, the Printer object NEED NOT return the attribute only once in the response even if it is
2119 requested multiple times. The client SHOULD NOT request the same attribute in multiple ways.

2120 It is NOT REQUIRED that a Job object support all attributes belonging to a group (since some attributes
2121 are OPTIONAL). However it is REQUIRED that each Job object support all group names.

2122 3.3.4.1 Get-Job-Attributes Request

2123 The following groups of attributes are part of the Get-Job-Attributes Request when the request is directed at
2124 a Job object:

2125 Group 1: Operation Attributes

2126 Natural Language and Character Set:

2127 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2128

2129 Target:
2130 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation
2131 attribute(s) which define the target for this operation as described in section 3.1.5.
2132

2133 Requesting User Name:
2134 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as
2135 described in section 8.3.
2136

2137 "requested-attributes" (1setOf keyword) :
2138 The client OPTIONALLY supplies this attribute. The IPP object MUST support this attribute. It is
2139 a set of attribute names and/or attribute group names in whose values the requester is interested. If
2140 the client omits this attribute, the IPP object MUST respond as if this attribute had been supplied
2141 with a value of 'all'.
2142

2143 3.3.4.2 Get-Job-Attributes Response

2144 The Printer object returns the following sets of attributes as part of the Get-Job-Attributes Response:

2145 Group 1: Operation Attributes

2146 Status Message:
2147 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY
2148 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.
2149

2150 Natural Language and Character Set:

2151 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.
2152 The "attributes-natural-language" MAY be the natural language of the Job object, rather than the
2153 one requested.
2154

2155 Group 2: Unsupported Attributes

2156 See section 3.1.7 for details on returning Unsupported Attributes.

2157
2158 The response NEED NOT contain the "requested-attributes" operation attribute with any supplied
2159 values (attribute keywords) that were requested by the client but are not supported by the IPP object.
2160 If the Printer object does include unsupported attributes referenced in "requested-attributes" and
2161 such attributes include group names, such as 'all', the unsupported attributes MUST NOT include
2162 attributes described in the standard but not supported by the implementation. **Issue 23**
2163

2164 Group 3: Job Object Attributes

2165 This is the set of requested attributes and their current values. The IPP object ignores (does not
2166 respond with) any requested attribute or value which is not supported or which is restricted by the
2167 security policy in force, including whether the requesting user is the user that submitted the job (job
2168 originating user) or not (see section 8). However, the IPP object MUST respond with the 'unknown'

2169 value for any supported attribute (including all REQUIRED attributes) for which the IPP object does
 2170 not know the value, unless it would violate the security policy. See the description of the "out-of-
 2171 band" values in the beginning of Section 4.1.

2172 3.3.5 Hold-Job Operation

2173 This OPTIONAL operation allows a client to hold a pending job in the queue so that it is not eligible for
 2174 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,
 2175 and vice-versa. The OPTIONAL "job-hold-until" operation attribute allows a client to specify whether to
 2176 hold the job indefinitely or until a specified time period, if supported.

2177 The IPP object MUST accept or reject the request based on the job's current state and transition the job to
 2178 the indicated new state as follows:

Current "job-state"	New "job-state"	IPP object's response status code and action:
'pending'	'pending-held'	'successful-ok' See Rule 1
'pending'	'pending'	'successful-ok' See Rule 2
'pending-held'	'pending-held'	'successful-ok' See Rule 1
'pending-held'	'pending'	'successful-ok' See Rule 2
'processing'	'processing'	'client-error-not-possible'
'processing-stopped'	'processing-stopped'	'client-error-not-possible'
'completed'	'completed'	'client-error-not-possible'
'canceled'	'canceled'	'client-error-not-possible'
'aborted'	'aborted'	'client-error-not-possible'

2179 Rule 1: If the implementation supports multiple reasons for a job to be in the 'pending-held' state, the IPP
 2180 object MUST add the 'job-hold-until-specified' value to the job's "job-state-reasons" attribute.

2181 Rule 2: If the IPP object supports the "job-hold-until" operation attribute, but the specified time period has
 2182 already started (or is the 'no-hold' value) and there are no other reasons to hold the job, the IPP object
 2183 MUST make the job be a candidate for processing immediately (see Section 4.2.2) by putting the job in the
 2184 'pending' state.

2185 Note: In order to keep the Hold-Job operation simple, such a request is rejected when the job is in the
 2186 'processing' or 'processing-stopped' states. If an operation is needed to hold jobs while in these states, it will
 2187 be added as an additional operation, rather than overloading the Hold-Job operation. Then it is clear to
 2188 clients by querying the Printer object's "operations-supported" (see Section 4.4.15) and the Job object's
 2189 "job-state" (see Section 4.3.7) attributes which operations are possible.

2190 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
 2191 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP
 2192 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or
 2193 'client-error-not-authorized' as appropriate.

2194 3.3.5.1 Hold-Job Request

2195 The groups and operation attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the
2196 addition of the following Group 1 Operation attribute:

2197 "job-hold-until" (type3 keyword | name(MAX)):

2198 The client OPTIONALLY supplies this Operation attribute. The IPP object MUST support this
2199 operation attribute in a Hold-Job request, if it supports the "job-hold-until" Job template attribute in
2200 create operations. See section 4.2.2. The IPP object SHOULD support the "job-hold-until" Job
2201 Template attribute for use in job create operations with at least the 'indefinite' value, if it supports
2202 the Hold-Job operation. Otherwise, a client cannot create a job and hold it immediately (without
2203 picking some supported time period in the future).

2204 If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP
2205 object copies the supplied operation attribute to the Job object, replacing the job's previous "job-
2206 hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied
2207 named time period.

2208 If supplied, but either the "job-hold-until" Operation attribute itself or the value supplied is not
2209 supported, the IPP object accepts the request, returns the unsupported attribute or value in the
2210 Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-
2211 substituted-attributes, and holds the job indefinitely until a client performs a subsequent Release-Job
2212 operation.

2213 If the client (1) supplies a value that specifies a time period that has already started or the 'no-hold'
2214 value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until" operation
2215 attribute and there are no other reasons to hold the job, the IPP object MUST accept the operation
2216 and make the job be a candidate for processing immediately (see Section 4.2.2).

2217 If the client does not supply a "job-hold-until" Operation attribute in the request, the IPP object
2218 MUST populate the job object with a "job-hold-until" attribute with the 'indefinite' value (if IPP
2219 object supports the "job-hold-until" attribute) and hold the job indefinitely, until a client performs a
2220 Release-Job operation.

2221 3.3.5.2 Hold-Job Response

2222 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2223 3.3.6 Release-Job Operation

2224 This OPTIONAL operation allows a client to release a previously held job so that it is again eligible for
2225 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,
2226 and vice-versa.

2227 This operation removes the "job-hold-until" job attribute, if present, from the job object that had been
2228 supplied in the create or most recent Hold-Job or Restart-Job operation and remove its effect on the job.

2229 **Issue 30** The IPP object MUST remove the 'job-hold-until-specified' value from the job's "job-state-
2230 reasons" attribute, if present. See section 4.3.8.

2231 The IPP object MUST accept or reject the request based on the job's current state and transition the job to
2232 the indicated new state as follows:

Current "job-state"	New "job-state"	IPP object's response status code and action:
'pending'	'pending'	'successful-ok' No effect on the job.
'pending-held'	'pending-held'	'successful-ok' See Rule 1
'pending-held'	'pending'	'successful-ok'
'processing'	'processing'	'successful-ok' No effect on the job.
'processing-stopped'	'processing-stopped'	'successful-ok' No effect on the job.
'completed'	'completed'	'client-error-not-possible'
'canceled'	'canceled'	'client-error-not-possible'
'aborted'	'aborted'	'client-error-not-possible'

2233 Rule 1: If there are other reasons to keep the job in the 'pending-held' state, such as 'resources-are-not-
2234 ready', the job remains in the 'pending-held' state. Thus the 'pending-held' state is not just for jobs that have
2235 the 'job-hold-until' applied to them, but are for any reason to keep the job from being a candidate for
2236 scheduling and processing, such as 'resources-are-not-ready'. See the "job-hold-until" attribute (section
2237 4.2.2).

2238 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
2239 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP
2240 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or
2241 'client-error-not-authorized' as appropriate.

2242 The Release-Job Request and Release-Job Response have the same attribute groups and attributes as the
2243 Cancel-Job operation (see section 3.3.3.1 and 3.3.3.2).

2244 3.3.7 Restart-Job Operation

2245 This OPTIONAL operation allows a client to restart a job that is retained in the queue after processing has
2246 completed (see section 4.3.7.2).

2247 The job is moved to the 'pending' job state and restarts at the beginning on the same IPP Printer object with
2248 the same attribute values. The Job Description attributes that accumulate job progress, such as "job-
2249 impressions-completed", "job-media-sheets-completed", and "job-k-octets-processed", MUST be reset to 0
2250 so that they give an accurate record of the job from its restart point. The job object MUST continue to use
2251 the same "job-uri" and "job-id" attribute values.

2252 Note: If in the future an operation is needed that does not reset the job progress attributes, then a new
2253 operation will be defined which makes a copy of the job, assigns a new "job-uri" and "job-id" to the copy
2254 and resets the job progress attributes in the new copy only.

2255 The IPP object **MUST** accept or reject the request based on the job's current state, transition the job to the
2256 indicated new state as follows:

Current "job-state"	New "job-state"	IPP object's response status code and action:
'pending'	'pending'	'client-error-not-possible'.
'pending-held'	'pending-held'	'client-error-not-possible'.
'processing'	'processing'	'client-error-not-possible'.
'processing-stopped'	'processing-stopped'	'client-error-not-possible'.
'completed'	'pending'	'successful-ok' - job is started over.
'completed'	'completed'	'client-error-not-possible' - see Rule 1
'canceled'	'pending'	'successful-ok' - job is started over.
'canceled'	'canceled'	'client-error-not-possible' - see Rule 1
'aborted'	'pending'	'successful-ok' - job is started over.
'aborted'	'aborted'	'client-error-not-possible' - see Rule 1

2257

2258 Rule 1: If the Job Retention Period has expired for the job in this state, then the IPP object rejects the
2259 operation. See section 4.3.7.2.

2260 Note: In order to prevent a user from inadvertently restarting a job in the middle, the Restart-Job request is
2261 rejected when the job is in the 'processing' or 'processing-stopped' states. If in the future an operation is
2262 needed to hold or restart jobs while in these states, it will be added as an additional operation, rather than
2263 overloading the Restart-Job operation, so that it is clear that the user intended that the current job not be
2264 completed.

2265 *Access Rights:* The authenticated user (see section 8.3) performing this operation must either be the job
2266 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP
2267 object **MUST** reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or
2268 'client-error-not-authorized' as appropriate.

2269 3.3.7.1 Restart-Job Request

2270 The groups and attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the addition of
2271 the following Group 1 Operation attribute:

2272 "job-hold-until" (type3 keyword | name(MAX)):

2273 The client **OPTIONALLY** supplies this attribute. The IPP object **MUST** support this Operation
2274 attribute in a Restart-Job request, if it supports the "job-hold-until" Job Template attribute in create
2275 operations. See section 4.2.2. Otherwise, the IPP object **NEED NOT** support the "job-hold-until"
2276 Operation attribute in a Restart-Job request.

2277 If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP
2278 object copies the supplied Operation attribute to the Job object, replacing the job's previous "job-
2279 hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied
2280 named time period. See section 4.2.2.

2281 If supplied, but the value is not supported, the IPP object accepts the request, returns the
2282 unsupported attribute or value in the Unsupported Attributes Group according to section 3.1.7,
2283 returns the 'successful-ok-ignored-or-substituted-attributes' status code, and holds the job
2284 indefinitely until a client performs a subsequent Release-Job operation.

2285 If supplied, but the "job-hold-until" Operation attribute itself is not supported, the IPP object accepts
2286 the request, returns the unsupported attribute with the out-of-band 'unsupported' value in the
2287 Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-
2288 substituted-attributes' status code, and restarts the job, i.e., ignores the "job-hold-until" attribute.

2289 If the client (1) supplies a value that specifies a time period that has already started or the 'no-hold'
2290 value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until" operation
2291 attribute and there are no other reasons to hold the job, the IPP object makes the job a candidate for
2292 processing immediately (see Section 4.2.2).

2293 If the client does not supply a "job-hold-until" operation attribute in the request, the IPP object
2294 removes the "job-hold-until" attribute, if present, from the job. If there are no other reasons to hold
2295 the job, the Restart-Job operation makes the job a candidate for processing immediately (see Section
2296 4.2.2).

2297 3.3.7.2 Restart-Job Response

2298 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2299 Note: In the future an OPTIONAL Modify-Job or Set-Job-Attributes operation may be specified that
2300 allows the client to modify other attributes before releasing the restarted job.

2301 4. Object Attributes

2302 This section describes the attributes with their corresponding attribute syntaxes and values that are part of
2303 the IPP model. The sections below show the objects and their associated attributes which are included
2304 within the scope of this protocol. Many of these attributes are derived from other relevant documents:

2305 - Document Printing Application (DPA) [ISO10175]

2306 - RFC 1759 Printer MIB [RFC1759]

2307

2308 Each attribute is uniquely identified in this document using a "keyword" (see section 12.2.1) which is the
2309 name of the attribute. The keyword is included in the section header describing that attribute.

2310 Note: Not only are keywords used to identify attributes, but one of the attribute syntaxes described below is
2311 "keyword" so that some attributes have keyword values. Therefore, these attributes are defined as having
2312 an attribute syntax that is a set of keywords.

2313 4.1 Attribute Syntaxes

2314 This section defines the basic attribute syntax types that all clients and IPP objects MUST be able to accept
2315 in responses and accept in requests, respectively. Each attribute description in sections 3 and 4 includes the
2316 name of attribute syntax(es) in the heading (in parentheses). A conforming implementation of an attribute
2317 MUST include the semantics of the attribute syntax(es) so identified. Section 6.3 describes how the
2318 protocol can be extended with new attribute syntaxes.

2319 The attribute syntaxes are specified in the following sub-sections, where the sub-section heading is the
2320 keyword name of the attribute syntax inside the single quotes. In operation requests and responses each
2321 attribute value MUST be represented as one of the attribute syntaxes specified in the sub-section heading
2322 for the attribute. In addition, the value of an attribute in a response (but not in a request) MAY be one of
2323 the "out-of-band" values whose special encoding rules are defined in the "Encoding and Transport"
2324 document [IPP-PRO]. Standard "out-of-band" values are: **Issue 12 and Issue 15**

2325 `unknown`: The attribute is supported by the IPP object, but the value is unknown to the IPP object for
2326 some reason.

2327 `unsupported`: The attribute is unsupported by the IPP object. This value MUST be returned only as the
2328 value of an attribute in the Unsupported Attributes Group.

2329 `no-value`: The attribute is supported by the Printer object, but the administrator has not yet configured a
2330 value.

2331

2332 All attributes in a request MUST have one or more values as defined in Sections 4.2 to 4.4. Thus clients
2333 MUST NOT supply attributes with "out-of-band" values. All attributes in a response MUST have one or
2334 more values as defined in Sections 4.2 to 4.4 or a single "out-of-band" value.

2335 Most attributes are defined to have a single attribute syntax. However, a few attributes (e.g., "job-sheet",
2336 "media", "job-hold-until") are defined to have several attribute syntaxes, depending on the value. These
2337 multiple attribute syntaxes are separated by the "|" character in the sub-section heading to indicate the
2338 choice. Since each value MUST be tagged as to its attribute syntax in the protocol, a single-valued attribute
2339 instance may have any one of its attribute syntaxes and a multi-valued attribute instance may have a mixture
2340 of its defined attribute syntaxes.

2341 4.1.1 `text`

2342 A text attribute is an attribute whose value is a sequence of zero or more characters encoded in a maximum
2343 of 1023 ('MAX') octets. MAX is the maximum length for each value of any text attribute. However, if an
2344 attribute will always contain values whose maximum length is much less than MAX, the definition of that
2345 attribute will include a qualifier that defines the maximum length for values of that attribute. For example:
2346 the "printer-location" attribute is specified as "printer-location (text(127))". In this case, text values for
2347 "printer-location" MUST NOT exceed 127 octets; if supplied with a longer text string via some external
2348 interface (other than the protocol), implementations are free to truncate to this shorter length limitation.

2349 In this document, all text attributes are defined using the `text` syntax. However, `text` is used only for
2350 brevity; the formal interpretation of `text` is: `textWithoutLanguage | textWithLanguage`. That is, for any

2351 attribute defined in this document using the `text` attribute syntax, all IPP objects and clients MUST support
2352 both the `textWithoutLanguage` and `textWithLanguage` attribute syntaxes. However, in actual usage and
2353 protocol execution, objects and clients accept and return only one of the two syntax per attribute. The
2354 syntax `text` never appears "on-the-wire".

2355 Both `textWithoutLanguage` and `textWithLanguage` are needed to support the real world needs of
2356 interoperability between sites and systems that use different natural languages as the basis for human
2357 communication. Generally, one natural language applies to all text attributes in a given request or response.
2358 The language is indicated by the "attributes-natural-language" operation attribute defined in section 3.1.4 or
2359 "attributes-natural-language" job attribute defined in section 4.3.20, and there is no need to identify the
2360 natural language for each text string on a value-by-value basis. In these cases, the attribute syntax
2361 `textWithoutLanguage` is used for text attributes. In other cases, the client needs to supply or the Printer
2362 object needs to return a text value in a natural language that is different from the rest of the text values in
2363 the request or response. In these cases, the client or Printer object uses the attribute syntax
2364 `textWithLanguage` for text attributes (this is the Natural Language Override mechanism described in
2365 section 3.1.4).

2366 The `textWithoutLanguage` and `textWithLanguage` attribute syntaxes are described in more detail in the
2367 following sections.

2368 4.1.1.1 `textWithoutLanguage`

2369 The `textWithoutLanguage` syntax indicates a value that is sequence of zero or more characters. Text
2370 strings are encoded using the rules of some charset. The Printer object MUST support the UTF-8 charset
2371 [RFC2279] and MAY support additional charsets to represent `text` values, provided that the charsets are
2372 registered with IANA [IANA-CS]. See Section 4.1.7 for the definition of the `charset` attribute syntax,
2373 including restricted semantics and examples of charsets.

2374 4.1.1.2 `textWithLanguage`

2375 The `textWithLanguage` attribute syntax is a compound attribute syntax consisting of two parts: a
2376 `textWithoutLanguage` part plus an additional `naturalLanguage` (see section 4.1.8) part that overrides the
2377 natural language in force. The `naturalLanguage` part explicitly identifies the natural language that applies
2378 to the text part of that value and that value alone. For any give text attribute, the `textWithoutLanguage` part
2379 is limited to the maximum length defined for that attribute, but the `naturalLanguage` part is always limited
2380 to 63 octets. Using the `textWithLanguage` attribute syntax rather than the normal `textWithoutLanguage`
2381 syntax is the so-called Natural Language Override mechanism and MUST be supported by all IPP objects
2382 and clients.

2383 If the attribute is multi-valued (1setOf text), then the `textWithLanguage` attribute syntax MUST be used to
2384 explicitly specify each attribute value whose natural language needs to be overridden. Other values in a
2385 multi-valued `text` attribute in a request or a response revert to the natural language of the operation
2386 attribute.

2387 In a create request, the Printer object MUST accept and store with the Job object any natural language in the
2388 "attributes-natural-language" operation attribute, whether the Printer object supports that natural language

2389 or not. Furthermore, the Printer object MUST accept and store any `textWithLanguage` attribute value,
2390 whether the Printer object supports that natural language or not. These requirements are independent of the
2391 value of the "ipp-attribute-fidelity" operation attribute that the client MAY supply.

2392 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: `en`
2393 indicating English, but the value of the "job-name" attribute is in French, the client MUST use the
2394 `textWithLanguage` attribute syntax with the following two values:

2395 `fr`: Natural Language Override indicating French
2396 `Rapport Mensuel`: the job name in French
2397

2398 See the "Encoding and Transport" document [IPP-PRO] for a detailed example of the `textWithLanguage`
2399 attribute syntax.

2400 4.1.2 `name`

2401 This syntax type is used for user-friendly strings, such as a Printer name, that, for humans, are more
2402 meaningful than identifiers. Names are never translated from one natural language to another. The `name`
2403 attribute syntax is essentially the same as `text`, including the REQUIRED support of UTF-8 except that the
2404 sequence of characters is limited so that its encoded form MUST NOT exceed 255 (MAX) octets.

2405 Also like `text`, `name` is really an abbreviated notation for either `nameWithoutLanguage` or
2406 `nameWithLanguage`. That is, all IPP objects and clients MUST support both the `nameWithoutLanguage`
2407 and `nameWithLanguage` attribute syntaxes. However, in actual usage and protocol execution, objects and
2408 clients accept and return only one of the two syntax per attribute. The syntax `name` never appears "on-the-
2409 wire".

2410 Only the `text` and `name` attribute syntaxes permit the Natural Language Override mechanism.

2411 Some attributes are defined as `type3 keyword | name`. These attributes support values that are either type3
2412 keywords or names. This dual-syntax mechanism enables a site administrator to extend these attributes to
2413 legally include values that are locally defined by the site administrator. Such names are not registered with
2414 IANA.

2415 4.1.2.1 `nameWithoutLanguage`

2416 The `nameWithoutLanguage` syntax indicates a value that is sequence of zero or more characters so that its
2417 encoded form does not exceed MAX octets.

2418 4.1.2.2 `nameWithLanguage`

2419 The `nameWithLanguage` attribute syntax is a compound attribute syntax consisting of two parts: a
2420 `nameWithoutLanguage` part plus an additional `naturalLanguage` (see section 4.1.8) part that overrides the
2421 natural language in force. The `naturalLanguage` part explicitly identifies the natural language that applies
2422 to that name value and that name value alone.

2423 The 'nameWithLanguage' attribute syntax behaves the same as the 'textWithLanguage' syntax. If a name is
2424 in a language that is different than the rest of the object or operation, then this 'nameWithLanguage' syntax
2425 is used rather than the generic 'nameWithoutLanguage' syntax.

2426 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: 'en'
2427 indicating English, but the "printer-name" attribute is in German, the client MUST use the
2428 'nameWithLanguage' attribute syntax as follows:

2429 'de': Natural Language Override indicating German
2430 'Farbdrucker': the Printer name in German
2431

2432 4.1.2.3 Matching 'name' attribute values

2433 For purposes of matching two 'name' attribute values for equality, such as in job validation (where a client-
2434 supplied value for attribute "xxx" is checked to see if the value is among the values of the Printer object's
2435 corresponding "xxx-supported" attribute), the following match rules apply:

2436 1. 'keyword' values never match 'name' values.

2437 2. 'name' (nameWithoutLanguage and nameWithLanguage) values match if (1) the name parts
2438 match and (2) the Associated Natural-Language parts (see section 3.1.4.1) match. The matching
2439 rules are:

2440 a. the name parts match if the two names are identical character by character, except it is
2441 RECOMMENDED that case be ignored. For example: 'Ajax-letter-head-white' MUST
2442 match 'Ajax-letter-head-white' and SHOULD match 'ajax-letter-head-white' and 'AJAX-
2443 LETTER-HEAD-WHITE'.

2444 b. the Associated Natural-Language parts match if the shorter of the two meets the syntactic
2445 requirements of RFC 1766 [RFC1766] and matches byte for byte with the longer. For
2446 example, 'en' matches 'en', 'en-us' and 'en-gb', but matches neither 'fr' nor 'e'.

2447 4.1.3 'keyword'

2448 The 'keyword' attribute syntax is a sequence of characters, length: 1 to 255, containing only the US-ASCII
2449 [ASCII] encoded values for lowercase letters ("a" - "z"), digits ("0" - "9"), hyphen ("-"), dot ("."), and
2450 underscore ("_"). The first character MUST be a lowercase letter. Furthermore, keywords MUST be in
2451 U.S. English.

2452 This syntax type is used for enumerating semantic identifiers of entities in the abstract protocol, i.e., entities
2453 identified in this document. Keywords are used as attribute names or values of attributes. Unlike 'text' and
2454 'name' attribute values, 'keyword' values MUST NOT use the Natural Language Override mechanism, since
2455 they MUST always be US-ASCII and U.S. English.

2456 Keywords are for use in the protocol. A user interface will likely provide a mapping between protocol
2457 keywords and displayable user-friendly words and phrases which are localized to the natural language of

2458 the user. While the keywords specified in this document MAY be displayed to users whose natural
2459 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users, since
2460 the user interface is outside the scope of this document.

2461 In the definition for each attribute of this syntax type, the full set of defined keyword values for that
2462 attribute are listed.

2463 When a keyword is used to represent an attribute (its name), it MUST be unique within the full scope of all
2464 IPP objects and attributes. When a keyword is used to represent a value of an attribute, it MUST be unique
2465 just within the scope of that attribute. That is, the same keyword MUST NOT be used for two different
2466 values within the same attribute to mean two different semantic ideas. However, the same keyword MAY
2467 be used across two or more attributes, representing different semantic ideas for each attribute. Section 6.1
2468 describes how the protocol can be extended with new keyword values. Examples of attribute name
2469 keywords:

2470 "job-name"

2471 "attributes-charset"

2472

2473 Note: This document uses "type1", "type2", and "type3" prefixes to the "keyword" basic syntax to indicate
2474 different levels of review for extensions (see section 6.1).

2475 4.1.4 'enum'

2476 The 'enum' attribute syntax is an enumerated integer value that is in the range from 1 to $2^{31} - 1$ (MAX).
2477 Each value has an associated 'keyword' name. In the definition for each attribute of this syntax type, the full
2478 set of possible values for that attribute are listed. This syntax type is used for attributes for which there are
2479 enum values assigned by other standards, such as SNMP MIBs. A number of attribute enum values in this
2480 document are also used for corresponding attributes in other standards [RFC1759]. This syntax type is not
2481 used for attributes to which the administrator may assign values. Section 6.1 describes how the protocol
2482 can be extended with new enum values.

2483 Enum values are for use in the protocol. A user interface will provide a mapping between protocol enum
2484 values and displayable user-friendly words and phrases which are localized to the natural language of the
2485 user. While the enum symbols specified in this document MAY be displayed to users whose natural
2486 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users, since
2487 the user interface is outside the scope of this document.

2488 Note: SNMP MIBs use '2' for 'unknown' which corresponds to the IPP "out-of-band" value 'unknown'. See
2489 the description of the "out-of-band" values at the beginning of Section 4.1. Therefore, attributes of type
2490 'enum' start at '3'.

2491 Note: This document uses "type1", "type2", and "type3" prefixes to the "enum" basic syntax to indicate
2492 different levels of review for extensions (see section 6.1).

2493 4.1.5 `uri`

2494 The `uri` attribute syntax is any valid Uniform Resource Identifier or URI [RFC2396]. Most often, URIs are
2495 simply Uniform Resource Locators or URLs. The maximum length of URIs used as values of IPP
2496 attributes is 1023 octets. Although most other IPP attribute syntax types allow for only lower-cased values,
2497 this attribute syntax type conforms to the case-sensitive and case-insensitive rules specified in [RFC2396].
2498 See also [IPP-IIG] for a discussion of case in URIs.

2499 4.1.6 `uriScheme`

2500 The `uriScheme` attribute syntax is a sequence of characters representing a URI scheme according to RFC
2501 2396 [RFC2396]. Though RFC 2396 requires that the values be case-insensitive, IPP requires all lower
2502 case values in IPP attributes to simplify comparing by IPP clients and Printer objects.

2503 Standard values for this syntax type are the following keywords:

2504 `ipp`: for IPP schemed URIs (e.g., "ipp:...")
2505 `http`: for HTTP schemed URIs (e.g., "http:...")
2506 `https`: for use with HTTPS schemed URIs (e.g., "https:...") (not on IETF standards track)
2507 `ftp`: for FTP schemed URIs (e.g., "ftp:...")
2508 `mailto`: for SMTP schemed URIs (e.g., "mailto:...")
2509 `file`: for file schemed URIs (e.g., "file:...")

2510

2511 A Printer object MAY support any URI `scheme` that has been registered with IANA [IANA-MT]. The
2512 maximum length of URI `scheme` values used to represent IPP attribute values is 63 octets.

2513 4.1.7 `charset`

2514 The `charset` attribute syntax is a standard identifier for a charset. A charset is a coded character set and
2515 encoding scheme. Charsets are used for labeling certain document contents and `text` and `name` attribute
2516 values. The syntax and semantics of this attribute syntax are specified in RFC 2046 [RFC2046] and
2517 contained in the IANA character-set Registry [IANA-CS] according to the IANA procedures [RFC2278].
2518 Though RFC 2046 requires that the values be case-insensitive US-ASCII, IPP requires all lower case values
2519 in IPP attributes to simplify comparing by IPP clients and Printer objects. When a character-set in the
2520 IANA registry has more than one name (alias), the name labeled as "(preferred MIME name)", if present,
2521 MUST be used.

2522 The maximum length of `charset` values used to represent IPP attribute values is 63 octets.

2523 Some examples are:

2524 `utf-8`: ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as the UTF-8
2525 [RFC2279] transfer encoding scheme in which US-ASCII is a subset charset.
2526 `us-ascii`: 7-bit American Standard Code for Information Interchange (ASCII), ANSI X3.4-1986
2527 [ASCII]. That standard defines US-ASCII, but RFC 2045 [RFC2045] eliminates most of the control
2528 characters from conformant usage in MIME and IPP.

2529 `iso-8859-1`: 8-bit One-Byte Coded Character Set, Latin Alphabet Nr 1 [ISO8859-1]. That standard
2530 defines a coded character set that is used by Latin languages in the Western Hemisphere and
2531 Western Europe. US-ASCII is a subset charset.
2532 `iso-10646-ucs-2`: ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as two
2533 octets (UCS-2), with the high order octet of each pair coming first (so-called Big Endian integer).
2534

2535 Some attribute descriptions MAY place additional requirements on charset values that may be used, such as
2536 REQUIRED values that MUST be supported or additional restrictions, such as requiring that the charset
2537 have US-ASCII as a subset charset.

2538 4.1.8 `naturalLanguage`

2539 The `naturalLanguage` attribute syntax is a standard identifier for a natural language and optionally a
2540 country. The values for this syntax type are defined by RFC 1766 [RFC1766]. Though RFC 1766 requires
2541 that the values be case-insensitive US-ASCII, IPP requires all lower case to simplify comparing by IPP
2542 clients and Printer objects. Examples include:

2543 `en`: for English
2544 `en-us`: for US English
2545 `fr`: for French
2546 `de`: for German

2547
2548 The maximum length of `naturalLanguage` values used to represent IPP attribute values is 63 octets.

2549 4.1.9 `mimeMediaType`

2550 The `mimeMediaType` attribute syntax is the Internet Media Type (sometimes called MIME type) as
2551 defined by RFC 2046 [RFC2046] and registered according to the procedures of RFC 2048 [RFC2048] for
2552 identifying a document format. The value MAY include a charset parameter, depending on the
2553 specification of the Media Type in the IANA Registry [IANA-MT]. Although most other IPP syntax types
2554 allow for only lower-cased values, this syntax type allows for mixed-case values which are case-insensitive.

2555 Examples are:

2556 `text/html`: An HTML document
2557 `text/plain`: A plain text document in US-ASCII (RFC 2046 indicates that in the absence of the charset
2558 parameter MUST mean US-ASCII rather than simply unspecified) [RFC2046].
2559 `text/plain; charset=US-ASCII`: A plain text document in US-ASCII [52, 56].
2560 `text/plain; charset=ISO-8859-1`: A plain text document in ISO 8859-1 (Latin 1) [ISO8859-1].
2561 `text/plain; charset=utf-8`: A plain text document in ISO 10646 represented as UTF-8 [RFC2279]
2562 `application/postscript`: A PostScript document [RFC2046]
2563 `application/vnd.hp-PCL`: A PCL document [IANA-MT] (charset escape sequence embedded in the
2564 document data)
2565 `application/pdf`: Portable Document Format - see IANA MIME Media Type registry
2566 `application/octet-stream`: Auto-sense - see section 4.1.9.1

2567

2568 4.1.9.1 Application/octet-stream -- Auto-Sensing the document format

2569 One special type is 'application/octet-stream'. If the Printer object supports this value, the Printer object
2570 MUST be capable of auto-sensing the format of the document data, either as part of the create operation
2571 and/or at document processing time. During auto-sensing, a Printer may determine that the document-data
2572 has a format that the Printer doesn't recognize. If the Printer determines this problem before returning an
2573 operation response, it rejects the request and returns the 'client-error-document-format-not-supported' status
2574 code. If the Printer determines this problem after accepting the request and returning an operation response
2575 with one of the successful status codes, the Printer adds the 'unsupported-document-format' value to the
2576 job's "job-state-reasons" attribute. **Issue 9 and Issue 10**

2577 If the Printer object's default value attribute "document-format-default" is set to 'application/octet-stream',
2578 the Printer object not only supports auto-sensing of the document format, but will depend on the result of
2579 applying its auto-sensing when the client does not supply the "document-format" attribute. If the client
2580 supplies a document format value, the Printer MUST rely on the supplied attribute, rather than trust its
2581 auto-sensing algorithm. To summarize:

- 2582 1. If the client does not supply a document format value, the Printer MUST rely on its default value
2583 setting (which may be 'application/octet-stream' indicating an auto-sensing mechanism).
- 2584 2. If the client supplies a value other than 'application/octet-stream', the client is supplying valid
2585 information about the format of the document data and the Printer object MUST trust the client
2586 supplied value more than the outcome of applying an automatic format detection mechanism. For
2587 example, the client may be requesting the printing of a PostScript file as a 'text/plain' document.
2588 The Printer object MUST print a text representation of the PostScript commands rather than
2589 interpret the stream of PostScript commands and print the result.
- 2590 3. If the client supplies a value of 'application/octet-stream', the client is indicating that the Printer
2591 object MUST use its auto-sensing mechanism on the client supplied document data whether auto-
2592 sensing is the Printer object's default or not.

2593

2594 Note: Since the auto-sensing algorithm is probabilistic, if the client requests both auto-sensing ("document-
2595 format" set to 'application/octet-stream') and true fidelity ("ipp-attribute-fidelity" set to 'true'), the Printer
2596 object might not be able to guarantee exactly what the end user intended (the auto-sensing algorithm might
2597 mistake one document format for another), but it is able to guarantee that its auto-sensing mechanism be
2598 used.

2599 The maximum length of a 'mimeType' value to represent IPP attribute values is 255 octets.

2600 4.1.10 'octetString'

2601 The 'octetString' attribute syntax is a sequence of octets encoded in a maximum of 1023 octets which is
2602 indicated in sub-section headers using the notation: octetString(MAX). This syntax type is used for opaque
2603 data.

2604 4.1.11 'boolean'

2605 The 'boolean' attribute syntax has only two values: 'true' and 'false'.

2606 4.1.12 'integer'

2607 The 'integer' attribute syntax is an integer value that is in the range from -2^{31} (MIN) to $2^{31} - 1$ (MAX).
2608 Each individual attribute may specify the range constraint explicitly in sub-section headers if the range is
2609 different from the full range of possible integer values. For example: job-priority (integer(1:100)) for the
2610 "job-priority" attribute. However, the enforcement of that additional constraint is up to the IPP objects, not
2611 the protocol.

2612 4.1.13 'rangeOfInteger'

2613 The 'rangeOfInteger' attribute syntax is an ordered pair of integers that defines an inclusive range of integer
2614 values. The first integer specifies the lower bound and the second specifies the upper bound. If a range
2615 constraint is specified in the header description for an attribute in this document whose attribute syntax is
2616 'rangeOfInteger' (i.e., 'X:Y' indicating X as a minimum value and Y as a maximum value), then the
2617 constraint applies to both integers.

2618 4.1.14 'dateTime'

2619 The 'dateTime' attribute syntax is a standard, fixed length, 11 octet representation of the "DateAndTime"
2620 syntax as defined in RFC 2579 [RFC2579]. RFC 2579 also identifies an 8 octet representation of a
2621 "DateAndTime" value, but IPP objects MUST use the 11 octet representation. A user interface will provide
2622 a mapping between protocol dateTime values and displayable user-friendly words or presentation values
2623 and phrases which are localized to the natural language and date format of the user, including time zone.

2624 4.1.15 'resolution'

2625 The 'resolution' attribute syntax specifies a two-dimensional resolution in the indicated units. It consists of
2626 3 values: a cross feed direction resolution (positive integer value), a feed direction resolution (positive
2627 integer value), and a units value. The semantics of these three components are taken from the Printer MIB
2628 [RFC1759] suggested values. That is, the cross feed direction component resolution component is the same
2629 as the prtMarkerAddressabilityXFeedDir object in the Printer MIB, the feed direction component resolution
2630 component is the same as the prtMarkerAddressabilityFeedDir in the Printer MIB, and the units component
2631 is the same as the prtMarkerAddressabilityUnit object in the Printer MIB (namely, '3' indicates dots per inch
2632 and '4' indicates dots per centimeter). All three values MUST be present even if the first two values are the
2633 same. Example: '300', '600', '3' indicates a 300 dpi cross-feed direction resolution, a 600 dpi feed direction
2634 resolution, since a '3' indicates dots per inch (dpi).

2635 4.1.16 '1setOf X'

2636 The '1setOf X' attribute syntax is 1 or more values of attribute syntax type X. This syntax type is used for
2637 multi-valued attributes. The syntax type is called '1setOf' rather than just 'setOf' as a reminder that the set

2638 of values MUST NOT be empty (i.e., a set of size 0). Sets are normally unordered. However each attribute
2639 description of this type may specify that the values MUST be in a certain order for that attribute.

2640 4.2 Job Template Attributes

2641 Job Template attributes describe job processing behavior. Support for Job Template attributes by a Printer
2642 object is OPTIONAL (see section 12.2.3 for a description of support for OPTIONAL attributes). Also,
2643 clients OPTIONALLY supply Job Template attributes in create requests.

2644 Job Template attributes conform to the following rules. For each Job Template attribute called "xxx":

2645 1. If the Printer object supports "xxx" then it MUST support both a "xxx-default" attribute (unless there
2646 is a "No" in the table below) and a "xxx-supported" attribute. If the Printer object doesn't support
2647 "xxx", then it MUST support neither an "xxx-default" attribute nor an "xxx-supported" attribute,
2648 and it MUST treat an attribute "xxx" supplied by a client as unsupported. An attribute "xxx" may be
2649 supported for some document formats and not supported for other document formats. For example,
2650 it is expected that a Printer object would only support "orientation-requested" for some document
2651 formats (such as 'text/plain' or 'text/html') but not others (such as 'application/postscript').

2652

2653 2. "xxx" is OPTIONALLY supplied by the client in a create request. If "xxx" is supplied, the client is
2654 indicating a desired job processing behavior for this Job. When "xxx" is not supplied, the client is
2655 indicating that the Printer object apply its default job processing behavior at job processing time if
2656 the document content does not contain an embedded instruction indicating an xxx-related behavior.

2657

2658 Since an administrator MAY change the default value attribute after a Job object has been submitted
2659 but before it has been processed, the default value used by the Printer object at job processing time
2660 may be different than the default value in effect at job submission time.

2661

2662 3. The "xxx-supported" attribute is a Printer object attribute that describes which job processing
2663 behaviors are supported by that Printer object. A client can query the Printer object to find out what
2664 xxx-related behaviors are supported by inspecting the returned values of the "xxx-supported"
2665 attribute.

2666

2667 Note: The "xxx" in each "xxx-supported" attribute name is singular, even though an "xxx-
2668 supported" attribute usually has more than one value, such as "job-sheet-supported", unless the
2669 "xxx" Job Template attribute is plural, such as "finishings" or "sides". In such cases the "xxx-
2670 supported" attribute names are: "finishings-supported" and "sides-supported".

2671

2672 4. The "xxx-default" default value attribute describes what will be done at job processing time when no
2673 other job processing information is supplied by the client (either explicitly as an IPP attribute in the
2674 create request or implicitly as an embedded instruction within the document data).

2675

2676 If an application wishes to present an end user with a list of supported values from which to choose, the
2677 application SHOULD query the Printer object for its supported value attributes. The application SHOULD
2678 also query the default value attributes. If the application then limits selectable values to only those value

2679 that are supported, the application can guarantee that the values supplied by the client in the create request
2680 all fall within the set of supported values at the Printer. When querying the Printer, the client MAY
2681 enumerate each attribute by name in the Get-Printer-Attributes Request, or the client MAY just name the
2682 "job-template" group in order to get the complete set of supported attributes (both supported and default
2683 attributes).

2684 The "finishings" attribute is an example of a Job Template attribute. It can take on a set of values such as
2685 'staple', 'punch', and/or 'cover'. A client can query the Printer object for the "finishings-supported" attribute
2686 and the "finishings-default" attribute. The supported attribute contains a set of supported values. The
2687 default value attribute contains the finishing value(s) that will be used for a new Job if the client does not
2688 supply a "finishings" attribute in the create request and the document data does not contain any
2689 corresponding finishing instructions. If the client does supply the "finishings" attribute in the create
2690 request, the IPP object validates the value or values to make sure that they are a subset of the supported
2691 values identified in the Printer object's "finishings-supported" attribute. See section 3.1.7.

2692 The table below summarizes the names and relationships for all Job Template attributes. The first column
2693 of the table (labeled "Job Attribute") shows the name and syntax for each Job Template attribute in the Job
2694 object. These are the attributes that can optionally be supplied by the client in a create request. The last
2695 two columns (labeled "Printer: Default Value Attribute" and "Printer: Supported Values Attribute") shows
2696 the name and syntax for each Job Template attribute in the Printer object (the default value attribute and the
2697 supported values attribute). A "No" in the table means the Printer MUST NOT support the attribute (that is,
2698 the attribute is simply not applicable). For brevity in the table, the 'text' and 'name' entries do not show the
2699 maximum length for each attribute.

2700	+=====+		
2701	Job Attribute	Printer: Default Value	Printer: Supported

2761

2762

2763 4.2.1 job-priority (integer(1:100))

2764 This attribute specifies a priority for scheduling the Job. A higher value specifies a higher priority. The
 2765 value 1 indicates the lowest possible priority. The value 100 indicates the highest possible priority. Among
 2766 those jobs that are ready to print, a Printer **MUST** print all jobs with a priority value of n before printing
 2767 those with a priority value of n-1 for all n.

2768 If the Printer object supports this attribute, it **MUST** always support the full range from 1 to 100. No
 2769 administrative restrictions are permitted. This way an end-user can always make full use of the entire range
 2770 with any Printer object. If privileged jobs are implemented outside IPP/1.1, they **MUST** have priorities
 2771 higher than 100, rather than restricting the range available to end-users.

2772 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer
 2773 object **MUST** use the value of the Printer object's "job-priority-default" at job submission time (unlike most
 2774 Job Template attributes that are used if necessary at job processing time).

2775 The syntax for the "job-priority-supported" is also integer(1:100). This single integer value indicates the
 2776 number of priority levels supported. The Printer object **MUST** take the value supplied by the client and
 2777 map it to the closest integer in a sequence of n integers values that are evenly distributed over the range
 2778 from 1 to 100 using the formula:

2779
$$\text{roundToNearestInt}((100x+50)/n)$$

2780 where n is the value of "job-priority-supported" and x ranges from 0 through n-1.

2781 For example, if n=1 the sequence of values is 50; if n=2, the sequence of values is: 25 and 75; if n = 3, the
 2782 sequence of values is: 17, 50 and 83; if n = 10, the sequence of values is: 5, 15, 25, 35, 45, 55, 65, 75, 85,
 2783 and 95; if n = 100, the sequence of values is: 1, 2, 3, ... 100.

2784 If the value of the Printer object's "job-priority-supported" is 10 and the client supplies values in the range 1
 2785 to 10, the Printer object maps them to 5, in the range 11 to 20, the Printer object maps them to 15, etc.

2786 4.2.2 job-hold-until (type3 keyword | name (MAX))

2787 This attribute specifies the named time period during which the Job **MUST** become a candidate for printing.

2788 Standard keyword values for named time periods are:

2789 'no-hold': immediately, if there are not other reasons to hold the job

2790 'indefinite': - the job is held indefinitely, until a client performs a Release-Job (section 3.3.6)

2791 'day-time': during the day

2792 'evening': evening

2793 'night': night

2794 'weekend': weekend

2795 'second-shift': second-shift (after close of business)

2796 'third-shift': third-shift (after midnight)

2797

2798 An administrator **MUST** associate allowable print times with a named time period (by means outside the
2799 scope of this IPP/1.1 document). An administrator is encouraged to pick names that suggest the type of
2800 time period. An administrator **MAY** define additional values using the 'name' or 'keyword' attribute syntax,
2801 depending on implementation.

2802 If the value of this attribute specifies a time period that is in the future, the Printer **MUST** add the 'job-hold-
2803 until-specified' value to the job's "job-state-reasons" attribute, move the job to the 'pending-held' state, and
2804 **MUST NOT** schedule the job for printing until the specified time-period arrives. When the specified time
2805 period arrives, the Printer **MUST** remove the 'job-hold-until-specified' value from the job's "job-state-
2806 reason" attribute and, if there are no other job state reasons that keep the job in the 'pending-held' state, the
2807 Printer **MUST** consider the job as a candidate for processing by moving the job to the 'pending' state.

2808 If this job attribute value is the named value 'no-hold', or the specified time period has already started, the
2809 job **MUST** be a candidate for processing immediately.

2810 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer
2811 object **MUST** use the value of the Printer object's "job-hold-until-default" at job submission time (unlike
2812 most Job Template attributes that are used if necessary at job processing time).

2813 4.2.3 job-sheets (type3 keyword | name(MAX))

2814 This attribute determines which job start/end sheet(s), if any, **MUST** be printed with a job.

2815 Standard keyword values are:

2816 'none': no job sheet is printed

2817 'standard': one or more site specific standard job sheets are printed, e.g. a single start sheet or both start
2818 and end sheet is printed

2819

2820 An administrator **MAY** define additional values using the 'name' or 'keyword' attribute syntax, depending
2821 on implementation.

2822 The effect of this attribute on jobs with multiple documents MAY be affected by the "multiple-document-
2823 handling" job attribute (section 4.2.4), depending on the job sheet semantics.

2824 4.2.4 multiple-document-handling (type2 keyword)

2825 This attribute is relevant only if a job consists of two or more documents. This attribute MUST be
2826 supported if the Printer supports multiple documents per job (see sections 3.2.4 and 3.3.1). **Issue 34** The
2827 attribute controls finishing operations and the placement of one or more print-stream pages into impressions
2828 and onto media sheets. When the value of the "copies" attribute exceeds 1, it also controls the order in
2829 which the copies that result from processing the documents are produced. For the purposes of this
2830 explanation, if "a" represents an instance of document data, then the result of processing the data in
2831 document "a" is a sequence of media sheets represented by "a(*)".

2832 Standard keyword values are:

2833 'single-document': If a Job object has multiple documents, say, the document data is called a and b, then
2834 the result of processing all the document data (a and then b) MUST be treated as a single sequence
2835 of media sheets for finishing operations; that is, finishing would be performed on the concatenation
2836 of the sequences a(*),b(*). The Printer object MUST NOT force the data in each document instance
2837 to be formatted onto a new print-stream page, nor to start a new impression on a new media sheet. If
2838 more than one copy is made, the ordering of the sets of media sheets resulting from processing the
2839 document data MUST be a(*), b(*), a(*), b(*), ..., and the Printer object MUST force each copy
2840 (a(*),b(*)) to start on a new media sheet.

2841 'separate-documents-uncollated-copies': If a Job object has multiple documents, say, the document data
2842 is called a and b, then the result of processing the data in each document instance MUST be treated
2843 as a single sequence of media sheets for finishing operations; that is, the sets a(*) and b(*) would
2844 each be finished separately. The Printer object MUST force each copy of the result of processing the
2845 data in a single document to start on a new media sheet. If more than one copy is made, the ordering
2846 of the sets of media sheets resulting from processing the document data MUST be a(*), a(*), ...,
2847 b(*), b(*)

2848 'separate-documents-collated-copies': If a Job object has multiple documents, say, the document data is
2849 called a and b, then the result of processing the data in each document instance MUST be treated as
2850 a single sequence of media sheets for finishing operations; that is, the sets a(*) and b(*) would each
2851 be finished separately. The Printer object MUST force each copy of the result of processing the data
2852 in a single document to start on a new media sheet. If more than one copy is made, the ordering of
2853 the sets of media sheets resulting from processing the document data MUST be a(*), b(*), a(*), b(*),
2854

2855 'single-document-new-sheet': Same as 'single-document', except that the Printer object MUST ensure
2856 that the first impression of each document instance in the job is placed on a new media sheet. This
2857 value allows multiple documents to be stapled together with a single staple where each document
2858 starts on a new sheet.
2859

2860 The 'single-document' value is the same as 'separate-documents-collated-copies' with respect to ordering of
2861 print-stream pages, but not media sheet generation, since 'single-document' will put the first page of the
2862 next document on the back side of a sheet if an odd number of pages have been produced so far for the job,

2863 while 'separate-documents-collated-copies' always forces the next document or document copy on to a new
 2864 sheet. In addition, if the "finishings" attribute specifies 'staple', then with 'single-document', documents a
 2865 and b are stapled together as a single document with no regard to new sheets, with 'single-document-new-
 2866 sheet', documents a and b are stapled together as a single document, but document b starts on a new sheet,
 2867 but with 'separate-documents-uncollated-copies' and 'separate-documents-collated-copies', documents a and
 2868 b are stapled separately.

2869 Note: None of these values provide means to produce uncollated sheets within a document, i.e., where
 2870 multiple copies of sheet n are produced before sheet n+1 of the same document.

2871 The relationship of this attribute and the other attributes that control document processing is described in
 2872 section 15.3.

2873 4.2.5 copies (integer(1:MAX))

2874 This attribute specifies the number of copies to be printed.

2875 On many devices the supported number of collated copies will be limited by the number of physical output
 2876 bins on the device, and may be different from the number of uncollated copies which can be supported.

2877 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
 2878 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
 2879 control document processing is described in section 15.3.

2880 4.2.6 finishings (1setOf type2 enum)

2881 This attribute identifies the finishing operations that the Printer uses for each copy of each printed
 2882 document in the Job. For Jobs with multiple documents, the "multiple-document-handling" attribute
 2883 determines what constitutes a "copy" for purposes of finishing.

2884 Standard enum values are:

2885	Value	Symbolic Name and Description
2886		
2887	'3'	'none': Perform no finishing
2888	'4'	'staple': Bind the document(s) with one or more staples. The exact number and placement of
2889		the staples is site-defined.
2890	'5'	'punch': This value indicates that holes are required in the finished document. The exact
2891		number and placement of the holes is site-defined The punch specification MAY be
2892		satisfied (in a site- and implementation-specific manner) either by drilling/punching,
2893		or by substituting pre-drilled media.
2894	'6'	'cover': This value is specified when it is desired to select a non-printed (or pre-printed)
2895		cover for the document. This does not supplant the specification of a printed cover
2896		(on cover stock medium) by the document itself.
2897	'7'	'bind': This value indicates that a binding is to be applied to the document; the type and
2898		placement of the binding is site-defined.

2899

2900 '8' 'saddle-stitch': Bind the document(s) with one or more staples (wire stitches) along the
 2901 middle fold. The exact number and placement of the staples and the middle fold is
 2902 implementation and/or site-defined.

2903 '9' 'edge-stitch': Bind the document(s) with one or more staples (wire stitches) along one edge.
 2904 The exact number and placement of the staples is implementation and/or site-
 2905 defined.

2906 '10'-'19' reserved for future generic finishing enum values.

2907 The following values are more specific; they indicate a corner or an edge as if the document were a portrait
 2908 document (see below):

2909 '20' 'staple-top-left': Bind the document(s) with one or more staples in the top left corner.

2910 '21' 'staple-bottom-left': Bind the document(s) with one or more staples in the bottom left
 2911 corner.

2912 '22' 'staple-top-right': Bind the document(s) with one or more staples in the top right corner.

2913 '23' 'staple-bottom-right': Bind the document(s) with one or more staples in the bottom right
 2914 corner.

2915 '24' 'edge-stitch-left': Bind the document(s) with one or more staples (wire stitches) along the
 2916 left edge. The exact number and placement of the staples is implementation and/or
 2917 site-defined.

2918 '25' 'edge-stitch-top': Bind the document(s) with one or more staples (wire stitches) along the
 2919 top edge. The exact number and placement of the staples is implementation and/or
 2920 site-defined.

2921 '26' 'edge-stitch-right': Bind the document(s) with one or more staples (wire stitches) along the
 2922 right edge. The exact number and placement of the staples is implementation and/or
 2923 site-defined.

2924 '27' 'edge-stitch-bottom': Bind the document(s) with one or more staples (wire stitches) along
 2925 the bottom edge. The exact number and placement of the staples is implementation
 2926 and/or site-defined.

2927 '28' 'staple-dual-left': Bind the document(s) with two staples (wire stitches) along the left edge
 2928 assuming a portrait document (see above).

2929 '29' 'staple-dual-top': Bind the document(s) with two staples (wire stitches) along the top edge
 2930 assuming a portrait document (see above).

2931 '30' 'staple-dual-right': Bind the document(s) with two staples (wire stitches) along the right
 2932 edge assuming a portrait document (see above).

2933 '31' 'staple-dual-bottom': Bind the document(s) with two staples (wire stitches) along the bottom
 2934 edge assuming a portrait document (see above).

2935 The 'staple-xxx' values are specified with respect to the document as if the document were a portrait
 2936 document. If the document is actually a landscape or a reverse-landscape document, the client supplies the
 2937 appropriate transformed value. For example, to position a staple in the upper left hand corner of a
 2938 landscape document when held for reading, the client supplies the 'staple-bottom-left' value (since
 2939 landscape is defined as a +90 degree rotation from portrait, i.e., anti-clockwise). On the other hand, to
 2940 position a staple in the upper left hand corner of a reverse-landscape document when held for reading, the
 2941 client supplies the 'staple-top-right' value (since reverse-landscape is defined as a -90 degree rotation from
 2942 portrait, i.e., clockwise).

2943 The angle (vertical, horizontal, angled) of each staple with respect to the document depends on the
2944 implementation which may in turn depend on the value of the attribute.

2945 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
2946 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
2947 control document processing is described in section 15.3.

2948 If the client supplies a value of 'none' along with any other combination of values, it is the same as if only
2949 that other combination of values had been supplied (that is the 'none' value has no effect).

2950 4.2.7 page-ranges (1setOf rangeOfInteger (1:MAX))

2951 This attribute identifies the range(s) of print-stream pages that the Printer object uses for each copy of each
2952 document which are to be printed. Nothing is printed for any pages identified that do not exist in the
2953 document(s). Ranges MUST be in ascending order, for example: 1-3, 5-7, 15-19 and MUST NOT overlap,
2954 so that a non-spooling Printer object can process the job in a single pass. If the ranges are not ascending or
2955 are overlapping, the IPP object MUST reject the request and return the 'client-error-bad-request' status code.
2956 The attribute is associated with print-stream pages not application-numbered pages (for example, the page
2957 numbers found in the headers and or footers for certain word processing applications).

2958 For Jobs with multiple documents, the "multiple-document-handling" attribute determines what constitutes
2959 a "copy" for purposes of the specified page range(s). When "multiple-document-handling" is 'single-
2960 document', the Printer object MUST apply each supplied page range once to the concatenation of the print-
2961 stream pages. For example, if there are 8 documents of 10 pages each, the page-range '41:60' prints the
2962 pages in the 5th and 6th documents as a single document and none of the pages of the other documents are
2963 printed. When "multiple-document-handling" is 'separate-documents-uncollated-copies' or 'separate-
2964 documents-collated-copies', the Printer object MUST apply each supplied page range repeatedly to each
2965 document copy. For the same job, the page-range '1:3, 10:10' would print the first 3 pages and the 10th
2966 page of each of the 8 documents in the Job, as 8 separate documents.

2967 In most cases, the exact pages to be printed will be generated by a device driver and this attribute would not
2968 be required. However, when printing an archived document which has already been formatted, the end user
2969 may elect to print just a subset of the pages contained in the document. In this case, if page-range = n.m is
2970 specified, the first page to be printed will be page n. All subsequent pages of the document will be printed
2971 through and including page m.

2972 "page-ranges-supported" is a boolean value indicating whether or not the printer is capable of supporting
2973 the printing of page ranges. This capability may differ from one PDL to another. There is no "page-ranges-
2974 default" attribute. If the "page-ranges" attribute is not supplied by the client, all pages of the document will
2975 be printed.

2976 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
2977 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
2978 control document processing is described in section 15.3.

2979 4.2.8 sides (type2 keyword)

2980 This attribute specifies how print-stream pages are to be imposed upon the sides of an instance of a selected
2981 medium, i.e., an impression.

2982 The standard keyword values are:

2983 'one-sided': imposes each consecutive print-stream page upon the same side of consecutive media
2984 sheets.

2985 'two-sided-long-edge': imposes each consecutive pair of print-stream pages upon front and back sides of
2986 consecutive media sheets, such that the orientation of each pair of print-stream pages on the medium
2987 would be correct for the reader as if for binding on the long edge. This imposition is sometimes
2988 called 'duplex' or 'head-to-head'.

2989 'two-sided-short-edge': imposes each consecutive pair of print-stream pages upon front and back sides
2990 of consecutive media sheets, such that the orientation of each pair of print-stream pages on the
2991 medium would be correct for the reader as if for binding on the short edge. This imposition is
2992 sometimes called 'tumble' or 'head-to-toe'.

2993

2994 'two-sided-long-edge', 'two-sided-short-edge', 'tumble', and 'duplex' all work the same for portrait or
2995 landscape. However 'head-to-toe' is 'tumble' in portrait but 'duplex' in landscape. 'head-to-head' also
2996 switches between 'duplex' and 'tumble' when using portrait and landscape modes.

2997 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
2998 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
2999 control document processing is described in section 15.3.

3000 4.2.9 number-up (integer(1:MAX))

3001 This attribute specifies the number of print-stream pages to impose upon a single side of an instance of a
3002 selected medium. For example, if the value is:

3003 Value	Description
3004 '1'	the Printer MUST place one print-stream page on a single side of an instance of the selected
3005 '2'	the Printer MUST place two print-stream pages on a single side of an instance of the selected
3006 '4'	the Printer MUST place four print-stream pages on a single side of an instance of the

3005 '1'	the Printer MUST place one print-stream page on a single side of an instance of the selected 3006 medium (MAY add some sort of translation, scaling, or rotation).
3007 '2'	the Printer MUST place two print-stream pages on a single side of an instance of the selected 3008 medium (MAY add some sort of translation, scaling, or rotation).
3009 '4'	the Printer MUST place four print-stream pages on a single side of an instance of the 3010 selected medium (MAY add some sort of translation, scaling, or rotation).

3011

3012 This attribute primarily controls the translation, scaling and rotation of print-stream pages.

3013 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
3014 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
3015 control document processing is described in section 15.3.

3016 4.2.10 orientation-requested (type2 enum)

3017 This attribute indicates the desired orientation for printed print-stream pages; it does not describe the
3018 orientation of the client-supplied print-stream pages.

3019 For some document formats (such as 'application/postscript'), the desired orientation of the print-stream
3020 pages is specified within the document data. This information is generated by a device driver prior to the
3021 submission of the print job. Other document formats (such as 'text/plain') do not include the notion of
3022 desired orientation within the document data. In the latter case it is possible for the Printer object to bind
3023 the desired orientation to the document data after it has been submitted. It is expected that a Printer object
3024 would only support "orientations-requested" for some document formats (e.g., 'text/plain' or 'text/html') but
3025 not others (e.g., 'application/postscript'). This is no different than any other Job Template attribute since
3026 section 4.2, item 1, points out that a Printer object may support or not support any Job Template attribute
3027 based on the document format supplied by the client. However, a special mention is made here since it is
3028 very likely that a Printer object will support "orientation-requested" for only a subset of the supported
3029 document formats.

3030 Standard enum values are:

3031	Value	Symbolic Name and Description
3032		
3033	'3'	'portrait': The content will be imaged across the short edge of the medium.
3034	'4'	'landscape': The content will be imaged across the long edge of the medium. Landscape is
3035		defined to be a rotation of the print-stream page to be imaged by +90 degrees with
3036		respect to the medium (i.e. anti-clockwise) from the portrait orientation. Note: The
3037		+90 direction was chosen because simple finishing on the long edge is the same edge
3038		whether portrait or landscape
3039	'5'	'reverse-landscape': The content will be imaged across the long edge of the medium.
3040		Reverse-landscape is defined to be a rotation of the print-stream page to be imaged
3041		by -90 degrees with respect to the medium (i.e. clockwise) from the portrait
3042		orientation. Note: The 'reverse-landscape' value was added because some
3043		applications rotate landscape -90 degrees from portrait, rather than +90 degrees.
3044	'6'	'reverse-portrait': The content will be imaged across the short edge of the medium. Reverse-
3045		portrait is defined to be a rotation of the print-stream page to be imaged by 180
3046		degrees with respect to the medium from the portrait orientation. Note: The 'reverse-
3047		portrait' value was added for use with the "finishings" attribute in cases where the
3048		opposite edge is desired for finishing a portrait document on simple finishing devices
3049		that have only one finishing position. Thus a 'text/plain' portrait document can be
3050		stapled "on the right" by a simple finishing device as is common use with some
3051		middle eastern languages such as Hebrew.
3052		

3053 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-
3054 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that
3055 control document processing is described in section 15.3.

3056 4.2.11 media (type3 keyword | name(MAX))

3057 This attribute identifies the medium that the Printer uses for all impressions of the Job.

3058 The values for "media" include medium-names, medium-sizes, input-trays and electronic forms so that one
 3059 attribute specifies the media. If a Printer object supports a medium name as a value of this attribute, such a
 3060 medium name implicitly selects an input-tray that contains the specified medium. If a Printer object
 3061 supports a medium size as a value of this attribute, such a medium size implicitly selects a medium name
 3062 that in turn implicitly selects an input-tray that contains the medium with the specified size. If a Printer
 3063 object supports an input-tray as the value of this attribute, such an input-tray implicitly selects the medium
 3064 that is in that input-tray at the time the job prints. This case includes manual-feed input-trays. If a Printer
 3065 object supports an electronic form as the value of this attribute, such an electronic form implicitly selects a
 3066 medium-name that in turn implicitly selects an input-tray that contains the medium specified by the
 3067 electronic form. The electronic form also implicitly selects an image that the Printer MUST merge with the
 3068 document data as its prints each page.

3069 Standard keyword values are (taken from ISO DPA and the Printer MIB) and are listed in section 14. An
 3070 administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending on
 3071 implementation.

3072 There is also an additional Printer attribute named "media-ready" which differs from "media-supported" in
 3073 that legal values only include the subset of "media-supported" values that are physically loaded and ready
 3074 for printing with no operator intervention required. If an IPP object supports "media-supported", it NEED
 3075 NOT support "media-ready".

3076 The relationship of this attribute and the other attributes that control document processing is described in
 3077 section 15.3.

3078 4.2.12 printer-resolution (resolution)

3079 This attribute identifies the resolution that Printer uses for the Job.

3080 4.2.13 print-quality (type2 enum)

3081 This attribute specifies the print quality that the Printer uses for the Job.

3082 The standard enum values are:

3083	Value	Symbolic Name and Description
3084		
3085	'3'	'draft': lowest quality available on the printer
3086	'4'	'normal': normal or intermediate quality on the printer
3087	'5'	'high': highest quality available on the printer
3088		

3089 4.3 Job Description Attributes

3090 The attributes in this section form the attribute group called "job-description". The following table
3091 summarizes these attributes. The third column indicates whether the attribute is a REQUIRED attribute
3092 that MUST be supported by Printer objects. If it is not indicated as REQUIRED, then it is OPTIONAL.
3093 The maximum size in octets for 'text' and 'name' attributes is indicated in parentheses.

	Attribute	Syntax	REQUIRED?
3094			
3095			
3096			
3097	job-uri	uri	REQUIRED
3098			
3099	job-id	integer(1:MAX)	REQUIRED
3100			
3101	job-printer-uri	uri	REQUIRED
3102			
3103	job-more-info	uri	
3104			
3105	job-name	name (MAX)	REQUIRED
3106			
3107	job-originating-user-name	name (MAX)	REQUIRED
3108			
3109	job-state	type1 enum	REQUIRED
3110			
3111	job-state-reasons	1setOf type2 keyword	REQUIRED
3112			
3113	job-state-message	text (MAX)	
3114			
3115	number-of-documents	integer (0:MAX)	
3116

3155 4.3.1 job-uri (uri)

3156 This REQUIRED attribute contains the URI for the job. The Printer object, on receipt of a new job,
 3157 generates a URI which identifies the new Job. The Printer object returns the value of the "job-uri" attribute
 3158 as part of the response to a create request. The precise format of a Job URI is implementation dependent.
 3159 If the Printer object supports more than one URI and there is some relationship between the newly formed
 3160 Job URI and the Printer object's URI, the Printer object uses the Printer URI supplied by the client in the
 3161 create request. For example, if the create request comes in over a secure channel, the new Job URI MUST
 3162 use the same secure channel. This can be guaranteed because the Printer object is responsible for
 3163 generating the Job URI and the Printer object is aware of its security configuration and policy as well as the
 3164 Printer URI used in the create request.

3165 For a description of this attribute and its relationship to "job-id" and "job-printer-uri" attribute, see the
 3166 discussion in section 2.4 on "Object Identity".

3167 4.3.2 job-id (integer(1:MAX))

3168 This REQUIRED attribute contains the ID of the job. The Printer, on receipt of a new job, generates an ID
 3169 which identifies the new Job on that Printer. The Printer returns the value of the "job-id" attribute as part of
 3170 the response to a create request. The 0 value is not included to allow for compatibility with SNMP index
 3171 values which also cannot be 0.

3172 For a description of this attribute and its relationship to "job-uri" and "job-printer-uri" attribute, see the
 3173 discussion in section 2.4 on "Object Identity".

3174 4.3.3 job-printer-uri (uri)

3175 This REQUIRED attribute identifies the Printer object that created this Job object. When a Printer object
 3176 creates a Job object, it populates this attribute with the Printer object URI that was used in the create
 3177 request. This attribute permits a client to identify the Printer object that created this Job object when only
 3178 the Job object's URI is available to the client. The client queries the creating Printer object to determine
 3179 which languages, charsets, operations, are supported for this Job.

3180 For a description of this attribute and its relationship to "job-uri" and "job-id" attribute, see the discussion in
 3181 section 2.4 on "Object Identity".

3182 4.3.4 job-more-info (uri)

3183 Similar to "printer-more-info", this attribute contains the URI referencing some resource with more
3184 information about this Job object, perhaps an HTML page containing information about the Job.

3185 4.3.5 job-name (name(MAX))

3186 This REQUIRED attribute is the name of the job. It is a name that is more user friendly than the "job-uri"
3187 attribute value. It does not need to be unique between Jobs. The Job's "job-name" attribute is set to the
3188 value supplied by the client in the "job-name" operation attribute in the create request (see Section 3.2.1.1).
3189 If, however, the "job-name" operation attribute is not supplied by the client in the create request, the Printer
3190 object, on creation of the Job, MUST generate a name. The printer SHOULD generate the value of the
3191 Job's "job-name" attribute from the first of the following sources that produces a value: 1) the "document-
3192 name" operation attribute of the first (or only) document, 2) the "document-URI" attribute of the first (or
3193 only) document, or 3) any other piece of Job specific and/or Document Content information.

3194 4.3.6 job-originating-user-name (name(MAX))

3195 This REQUIRED attribute contains the name of the end user that submitted the print job. The Printer
3196 object sets this attribute to the most authenticated printable name that it can obtain from the authentication
3197 service over which the IPP operation was received. Only if such is not available, does the Printer object use
3198 the value supplied by the client in the "requesting-user-name" operation attribute of the create operation
3199 (see Section 8).

3200 Note: The Printer object needs to keep an internal originating user id of some form, typically as a credential
3201 of a principal, with the Job object. Since such an internal attribute is implementation-dependent and not of
3202 interest to clients, it is not specified as a Job Description attribute. This originating user id is used for
3203 authorization checks (if any) on all subsequent operation.

3204 4.3.7 job-state (type1 enum)

3205 This REQUIRED attribute identifies the current state of the job. Even though the IPP protocol defines
3206 seven values for job states (plus the out-of-band 'unknown' value - see Section 4.1), implementations only
3207 need to support those states which are appropriate for the particular implementation. In other words, a
3208 Printer supports only those job states implemented by the output device and available to the Printer object
3209 implementation.

3210 Standard enum values are:

3211 Values Symbolic Name and Description

3212
3213 '3' 'pending': The job is a candidate to start processing, but is not yet processing.

3214
3215 '4' 'pending-held': The job is not a candidate for processing for any number of reasons but will
3216 return to the 'pending' state as soon as the reasons are no longer present. The job's

3217 "job-state-reason" attribute MUST indicate why the job is no longer a candidate for
3218 processing.

3219
3220 '5' 'processing': One or more of:

- 3221
- 3222 1. the job is using, or is attempting to use, one or more purely software processes
3223 that are analyzing, creating, or interpreting a PDL, etc.,
 - 3224 2. the job is using, or is attempting to use, one or more hardware devices that are
3225 interpreting a PDL, making marks on a medium, and/or performing finishing, such as
3226 stapling, etc.,
 - 3227 3. the Printer object has made the job ready for printing, but the output device is not
3228 yet printing it, either because the job hasn't reached the output device or because the
3229 job is queued in the output device or some other spooler, awaiting the output device
3230 to print it.

3231

3232 When the job is in the 'processing' state, the entire job state includes the detailed
3233 status represented in the Printer object's "printer-state", "printer-state-reasons", and
3234 "printer-state-message" attributes.

3235 Implementations MAY, though they NEED NOT, include additional values in the
3236 job's "job-state-reasons" attribute to indicate the progress of the job, such as adding
3237 the 'job-printing' value to indicate when the output device is actually making marks
3238 on paper and/or the 'processing-to-stop-point' value to indicate that the IPP object is
3239 in the process of canceling or aborting the job. Most implementations won't bother
3240 with this nuance.

3241

3242 '6' 'processing-stopped': The job has stopped while processing for any number of reasons and
3243 will return to the 'processing' state as soon as the reasons are no longer present.

3244

3245 The job's "job-state-reason" attribute MAY indicate why the job has stopped
3246 processing. For example, if the output device is stopped, the 'printer-stopped' value
3247 MAY be included in the job's "job-state-reasons" attribute.

3248

3249 Note: When an output device is stopped, the device usually indicates its condition in
3250 human readable form locally at the device. A client can obtain more complete device
3251 status remotely by querying the Printer object's "printer-state", "printer-state-reasons"
3252 and "printer-state-message" attributes.

3253

3254 '7' 'canceled': The job has been canceled by a Cancel-Job operation and the Printer object has
3255 completed canceling the job and all job status attributes have reached their final
3256 values for the job. While the Printer object is canceling the job, the job remains in its
3257 current state, but the job's "job-state-reasons" attribute SHOULD contain the
3258 'processing-to-stop-point' value and one of the 'canceled-by-user', 'canceled-by-
3259 operator', or 'canceled-at-device' value. When the job moves to the 'canceled' state,

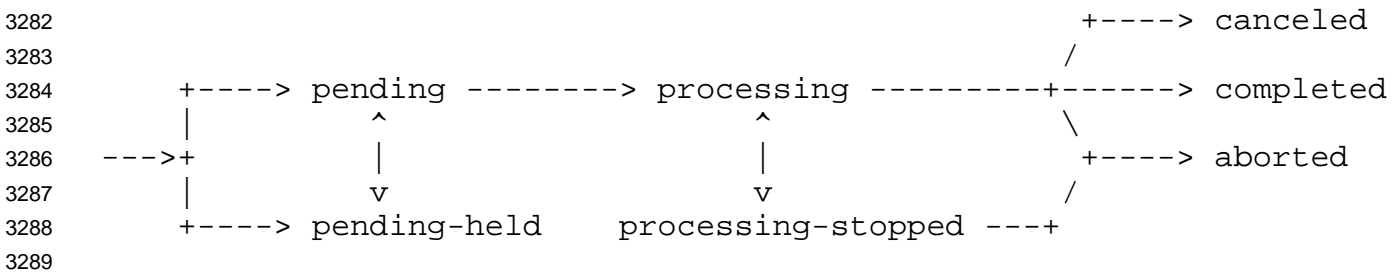

3260 the 'processing-to-stop-point' value, if present, MUST be removed, but the 'canceled-
3261 by-xxx', if present, MUST remain.

3262
3263 '8' 'aborted': The job has been aborted by the system, usually while the job was in the
3264 'processing' or 'processing-stopped' state and the Printer has completed aborting the
3265 job and all job status attributes have reached their final values for the job. While the
3266 Printer object is aborting the job, the job remains in its current state, but the job's
3267 "job-state-reasons" attribute SHOULD contain the 'processing-to-stop-point' and
3268 'aborted-by-system' values. When the job moves to the 'aborted' state, the
3269 'processing-to-stop-point' value, if present, MUST be removed, but the 'aborted-by-
3270 system' value, if present, MUST remain.

3271
3272 '9' 'completed': The job has completed successfully or with warnings or errors after processing
3273 and all of the job media sheets have been successfully stacked in the appropriate
3274 output bin(s) and all job status attributes have reached their final values for the job.
3275 The job's "job-state-reasons" attribute SHOULD contain one of: 'completed-
3276 successfully', 'completed-with-warnings', or 'completed-with-errors' values.

3277
3278 The final value for this attribute MUST be one of: 'completed', 'canceled', or 'aborted' before the Printer
3279 removes the job altogether. The length of time that jobs remain in the 'canceled', 'aborted', and 'completed'
3280 states depends on implementation. See section 4.3.7.2.

3281 The following figure shows the normal job state transitions.

3290 Normally a job progresses from left to right. Other state transitions are unlikely, but are not forbidden. Not
3291 shown are the transitions to the 'canceled' state from the 'pending', 'pending-held', and 'processing-stopped'
3292 states.

3293 Jobs reach one of the three terminal states: 'completed', 'canceled', or 'aborted', after the jobs have
3294 completed all activity, including stacking output media, after the jobs have completed all activity, and all
3295 job status attributes have reached their final values for the job.

3296 4.3.7.1 Forwarding Servers **Issue 14**

3297 As with all other IPP attributes, if the implementation cannot determine the correct value for this attribute,
3298 it SHOULD respond with the out-of-band value 'unknown' (see section 4.1) rather than try to guess at some
3299 possibly incorrect value and give the end user the wrong impression about the state of the Job object. For
3300 example, if the implementation is just a gateway into some printing system from which it can normally get

3301 status, but temporarily is unable, then the implementation should return the 'unknown' value. However, if
3302 the implementation is a gateway to a printing system that never provides detailed status about the print job,
3303 the implementation MAY set the IPP Job object's state to 'completed', provided that it also sets the 'queued-
3304 in-device' value in the job's "job-state-reasons" attribute (see section 4.3.8). **Issue 14**

3305 4.3.7.2 Partitioning of Job States

3306 This section partitions the 7 job states into phases: Job Not Completed, Job Retention, Job History, and Job
3307 Removal. This section also explains the 'job-restartable' value of the "job-state-reasons" Job Description
3308 attribute for use with the Restart-Job operation.

3309 Job Not Completed: When a job is in the 'pending', 'pending-held', 'processing', or 'processing-stopped'
3310 states, the job is not completed.

3311 Job Retention: When a job enters one of the three terminal job states: 'completed', 'canceled', or 'aborted',
3312 the IPP Printer object MAY "retain" the job in a restartable condition for an implementation-defined time
3313 period. This time period MAY be zero seconds and MAY depend on the terminal job state. This phase is
3314 called Job Retention. While in the Job Retention phase, the job's document data is retained and a client
3315 may restart the job using the Restart-Job operation. If the IPP object supports **Issue 30** the Restart-Job
3316 operation, then it SHOULD indicate that the job is restartable by adding the 'job-restartable' value to the
3317 job's "job-state-reasons" attribute (see Section 4.3.8) during the Job Retention phase.

3318 Job History: After the Job Retention phase expires for a job, the Printer object deletes the document data
3319 for the job and the job becomes part of the Job History. The Printer object MAY also delete any number of
3320 the job attributes. Since the job is no longer restartable, the Printer object MUST remove the 'job-
3321 restartable' value from the job's "job-state-reasons" attribute, if present.

3322 Job Removal: After the job has remained in the Job History for an implementation-defined time, such as
3323 when the number of jobs exceeds a fixed number or after a fixed time period (which MAY be zero
3324 seconds), the IPP Printer removes the job from the system.

3325 Using the Get-Jobs operation and supplying the 'not-completed' value for the "which-jobs" operation
3326 attribute, a client is requesting jobs in the Job Not Completed phase. Using the Get-Jobs operation and
3327 supplying the 'completed' value for the "which-jobs" operation attribute, a client is requesting jobs in the
3328 Job Retention and Job History phases. Using the Get-Job-Attributes operation, a client is requesting a job
3329 in any phase except Job Removal. After Job Removal, the Get-Job-Attributes and Get-Jobs operations no
3330 longer are capable of returning any information about a job.

3331 4.3.8 job-state-reasons (1setOf type2 keyword)

3332 This REQUIRED attribute provides additional information about the job's current state, i.e., information
3333 that augments the value of the job's "job-state" attribute.

3334 These values MAY be used with any job state or states for which the reason makes sense. Some of these
3335 value definitions indicate conformance requirements; the rest are OPTIONAL. **Issue 30** Furthermore,
3336 when implemented, the Printer MUST return these values when the reason applies and MUST NOT return
3337 them when the reason no longer applies whether the value of the Job's "job-state" attribute changed or not.

3338 When the Job does not have any reasons for being in its current state, the value of the Job's "job-state-
3339 reasons" attribute MUST be 'none'.

3340 Note: While values cannot be added to the 'job-state' attribute without impacting deployed clients that take
3341 actions upon receiving "job-state" values, it is the intent that additional "job-state-reasons" values can be
3342 defined and registered without impacting such deployed clients. In other words, the "job-state-reasons"
3343 attribute is intended to be extensible.

3344 The following standard keyword values are defined. For ease of understanding, the values are presented in
3345 the order in which the reasons are likely to occur (if implemented), starting with the 'job-incoming' value:

- 3346 'none': There are no reasons for the job's current state. This state reason is semantically equivalent to
3347 "job-state-reasons" without any value and MUST be used when there is no other value, since the
3348 lsetOf attribute syntax requires at least one value. **Issue 30**
- 3349 'job-incoming': The Create-Job operation has been accepted by the Printer, but the Printer is expecting
3350 additional Send-Document and/or Send-URI operations and/or is accessing/accepting document
3351 data.
- 3352 'job-data-insufficient': The Create-Job operation has been accepted by the Printer, but the Printer is
3353 expecting additional document data before it can move the job into the 'processing' state. If a Printer
3354 starts processing before it has received all data, the Printer removes the 'job-data-insufficient'
3355 reason, but the 'job-incoming' remains. If a Printer starts processing after it has received all data, the
3356 Printer removes the 'job-data-insufficient' reason and the 'job-incoming' at the same time. **Issue 13**
- 3357 'document-access-error': After accepting a Print-URI or Send-URI request, the Printer could not access
3358 one or more documents passed by reference. This reason is intended to cover any file access
3359 problem, including file does not exist and access denied because of an access control problem. The
3360 Printer MAY also indicate the document access error using the "job-document-access-errors" Job
3361 Description attribute (see section 4.3.11). Whether the Printer aborts the job and moves the job to
3362 the 'aborted' job state or prints all documents that are accessible and moves the job to the 'completed'
3363 job state and adds the 'completed-with-errors' value in the job's "job-state-reasons" attribute depends
3364 on implementation and/or site policy. This value SHOULD be supported if the Print-URI or Send-
3365 URI operations are supported. **Issue 30 and Issue 35**
- 3366 'submission-interrupted': The job was not completely submitted for some unforeseen reason, such as:
3367 (1) the Printer has crashed before the job was closed by the client, (2) the Printer or the document
3368 transfer method has crashed in some non-recoverable way before the document data was entirely
3369 transferred to the Printer, (3) the client crashed or failed to close the job before the time-out period.
3370 See section 4.4.31.
- 3371 'job-outgoing': The Printer is transmitting the job to the output device.
- 3372 'job-hold-until-specified': The value of the job's "job-hold-until" attribute was specified with a time
3373 period that is still in the future. The job MUST NOT be a candidate for processing until this reason
3374 is removed and there are no other reasons to hold the job. This value MUST be supported if the
3375 "job-hold-until" Job Template attribute is supported. **Issue 30**
- 3376 'resources-are-not-ready': At least one of the resources needed by the job, such as media, fonts, resource
3377 objects, etc., is not ready on any of the physical printer's for which the job is a candidate. This
3378 condition MAY be detected when the job is accepted, or subsequently while the job is pending or
3379 processing, depending on implementation. The job may remain in its current state or be moved to
3380 the 'pending-held' state, depending on implementation and/or job scheduling policy.

- 3381 'printer-stopped-partly': The value of the Printer's "printer-state-reasons" attribute contains the value
3382 'stopped-partly'.
- 3383 'printer-stopped': The value of the Printer's "printer-state" attribute is 'stopped'.
- 3384 'job-interpreting': Job is in the 'processing' state, but more specifically, the Printer is interpreting the
3385 document data.
- 3386 'job-queued': Job is in the 'processing' state, but more specifically, the Printer has queued the document
3387 data.
- 3388 'job-transforming': Job is in the 'processing' state, but more specifically, the Printer is interpreting
3389 document data and producing another electronic representation.
- 3390 'job-queued-for-marker': Job is in any of the 'pending-held', 'pending', or 'processing' states, but more
3391 specifically, the Printer has completed enough processing of the document to be able to start
3392 marking and the job is waiting for the marker. Systems that require human intervention to release
3393 jobs using the Release-Job operation, put the job into the 'pending-held' job state. Systems that
3394 automatically select a job to use the marker put the job into the 'pending' job state or keep the job in
3395 the 'processing' job state while waiting for the marker, depending on implementation. All
3396 implementations put the job into (or back into) the 'processing' state when marking does begin.
- 3397 **Issue 31**
- 3398 'job-printing': The output device is marking media. This value is useful for Printers which spend a great
3399 deal of time processing (1) when no marking is happening and then want to show that marking is
3400 now happening or (2) when the job is in the process of being canceled or aborted while the job
3401 remains in the 'processing' state, but the marking has not yet stopped so that impression or sheet
3402 counts are still increasing for the job.
- 3403 'job-canceled-by-user': The job was canceled by the owner of the job using the Cancel-Job request, i.e.,
3404 by a user whose authenticated identity is the same as the value of the originating user that created
3405 the Job object, or by some other authorized end-user, such as a member of the job owner's security
3406 group. This value SHOULD be supported. **Issue 30**
- 3407 'job-canceled-by-operator': The job was canceled by the operator using the Cancel-Job request, i.e., by a
3408 user who has been authenticated as having operator privileges (whether local or remote). If the
3409 security policy is to allow anyone to cancel anyone's job, then this value may be used when the job
3410 is canceled by other than the owner of the job. For such a security policy, in effect, everyone is an
3411 operator as far as canceling jobs with IPP is concerned. This value SHOULD be supported if the
3412 implementation permits canceling by other than the owner of the job. **Issue 30**
- 3413 'job-canceled-at-device': The job was canceled by an unidentified local user, i.e., a user at a console at
3414 the device. This value SHOULD be supported if the implementation supports canceling jobs at the
3415 console. **Issue 30**
- 3416 'aborted-by-system': The job (1) is in the process of being aborted, (2) has been aborted by the system
3417 and placed in the 'aborted' state, or (3) has been aborted by the system and placed in the 'pending-
3418 held' state, so that a user or operator can manually try the job again. This value SHOULD be
3419 supported. **Issue 30**
- 3420 'unsupported-compression': The job was aborted by the system because the Printer determined while
3421 attempting to decompress the document-data's that the compression is actually not among those
3422 supported by the Printer. This value MUST be supported, since "compressions is a REQUIRED
3423 operation attribute. **Issue 6**
- 3424 'compression-error': The job was aborted by the system because the Printer encountered an error in the
3425 document-data while decompressing it. If the Printer posts this reason, the document-data has

3426 already passed any tests that would have led to the 'unsupported-compression' job-state-reason. **Issue**
3427 **6**

3428 'unsupported-document-format': The job was aborted by the system because the document-data's
3429 document-format is not among those supported by the Printer. If the client specifies the document-
3430 format as 'application/octet-stream', the printer MAY abort the job and post this reason even though
3431 the format is a member of the "document-format-supported" printer attribute, but not among the
3432 auto-sensed document-formats. This value MUST be supported, since "document-format" is a
3433 REQUIRED operation attribute. **Issue 3**

3434 'document-format-error': The job was aborted by the system because the Printer encountered an error in
3435 the document-data while processing it. If the Printer posts this reason, the document-data has
3436 already passed any tests that would have led to the 'unsupported-document-format' job-state-reason.
3437 **Issue 3**

3438 'processing-to-stop-point': The requester has issued a Cancel-Job operation or the Printer object has
3439 aborted the job, but is still performing some actions on the job until a specified stop point occurs or
3440 job termination/cleanup is completed.

3441 If the implementation requires some measurable time to cancel the job in the 'processing' or
3442 'processing-stopped' job states, the IPP object MUST use this value **Issue 30** to indicate that the
3443 Printer object is still performing some actions on the job while the job remains in the 'processing' or
3444 'processing-stopped' state. After all the job's job description attributes have stopped incrementing,
3445 the Printer object moves the job from the 'processing' state to the 'canceled' or 'aborted' job states.

3446 'service-off-line': The Printer is off-line and accepting no jobs. All 'pending' jobs are put into the
3447 'pending-held' state. This situation could be true if the service's or document transform's input is
3448 impaired or broken.

3449 'job-completed-successfully': The job completed successfully. This value SHOULD be supported.
3450 **Issue 30**

3451 'job-completed-with-warnings': The job completed with warnings. This value SHOULD be supported
3452 if the implementation detects warnings. **Issue 30**

3453 'job-completed-with-errors': The job completed with errors (and possibly warnings too). This value
3454 SHOULD be supported if the implementation detects errors. **Issue 30**

3455 'job-restartable' - This job is retained (see section 4.3.7.2) and is currently able to be restarted using the
3456 Restart-Job operation (see section 3.3.7). If 'job-restartable' is a value of the job's 'job-state-reasons'
3457 attribute, then the IPP object MUST accept a Restart-Job operation for that job. This value
3458 SHOULD be supported if the Restart-Job operation is supported. **Issue 30**

3459 'queued-in-device': The job has been forwarded to a device or print system that is unable to send back
3460 status. The Printer sets the job's "job-state" attribute to 'completed' and adds the 'queued-in-device'
3461 value to the job's "job-state-reasons" attribute to indicate that the Printer has no additional
3462 information about the job and never will have any better information. See section 4.3.7.1. **Issue 14**

3463 4.3.9 job-state-message (text(MAX))

3464 This attribute specifies information about the "job-state" and "job-state-reasons" attributes in human
3465 readable text. If the Printer object supports this attribute, the Printer object MUST be able to generate this
3466 message in any of the natural languages identified by the Printer's "generated-natural-language-supported"
3467 attribute (see the "attributes-natural-language" operation attribute specified in Section 3.1.4.1).

3468 The value SHOULD NOT contain additional information not contained in the values of the "job-state" and
3469 "job-states-reasons" attributes, such as interpreter error information. Otherwise, application programs
3470 might attempt to parse the (localized text). For such additional information such as interpreter errors for
3471 application program consumption or specific document access errors, new attributes with keyword values,
3472 needs to be developed and registered.

3473 4.3.10 job-detailed-status-messages (1setOf text(MAX)) **Issue 35**

3474 This attribute specifies additional detailed and technical information about the job. Neither the Printer nor
3475 the client localizes the message(s), since they are intended for use by the system administrator or other
3476 experienced technical persons. Clients MUST NOT attempt to parse the value of this attribute. See "job-
3477 document-access-errors" (section 4.3.11) for additional errors that a program can process.

3478 4.3.11 job-document-access-errors (1setOf text(MAX)) **Issue 35**

3479 This attribute provides additional information about each document access error for this job encountered by
3480 the Printer after it returned a response to the Print-URI or Send-URI operation and subsequently attempted
3481 to access document(s) supplied in the Print-URI or Send-URI operation. For errors in the protocol that is
3482 identified by the URI scheme in the "document-uri" operation attribute, such as 'http:' or 'ftp:', the error code
3483 is returned in parentheses, followed by the URI. For example:

3484 (404) http://ftp.pwg.org/pub/pwg/ipp/new_MOD/ipp-model-v11-990510.pdf
3485

3486 Most Internet protocols use decimal error codes (unlike IPP), so the ASCII error code representation is in
3487 decimal.

3488 4.3.12 number-of-documents (integer(0:MAX))

3489 This attribute indicates the number of documents in the job, i.e., the number of Send-Document, Send-URI,
3490 Print-Job, or Print-URI operations that the Printer has accepted for this job, regardless of whether the
3491 document data has reached the Printer object or not.

3492 Implementations supporting the OPTIONAL Create-Job/Send-Document/Send-URI operations SHOULD
3493 support this attribute so that clients can query the number of documents in each job.

3494 4.3.13 output-device-assigned (name(127))

3495 This attribute identifies the output device to which the Printer object has assigned this job. If an output
3496 device implements an embedded Printer object, the Printer object NEED NOT set this attribute. If a print
3497 server implements a Printer object, the value MAY be empty (zero-length string) or not returned until the
3498 Printer object assigns an output device to the job. This attribute is particularly useful when a single Printer
3499 object support multiple devices (so called "fan-out").

3500 4.3.14 Event Time Job Description Attributes **Issue 17**

3501 This section defines the Job Description attributes that indicate the time at which certain events occur for a
3502 job. If the job event has not yet occurred, then the IPP object MUST return the 'no-value' out-of-band value
3503 (see the beginning of Section 4.1). The "time-at-xxx(integer)" attributes represent time as an 'integer'
3504 representing the number of seconds since the device was powered up (informally called "time ticks"). The
3505 "date-time-at-xxx(dateTime)" attributes represent time as 'dateTime' representing date and time (including
3506 an offset from UTC).

3507 In order to populate these attributes, the Printer object copies the value(s) of the following Printer
3508 Description attributes at the time the event occurs:

- 3509 1. the value in the Printer's "printer-up-time" attribute for the "time-at-xxx(integer)" attributes
- 3510 2. the value in the Printer's "printer-current-time" attribute for the "date-time-at-xxx(dateTime)"
3511 attributes.

3512 If the Printer resets its "printer-up-time" attribute to 1 on power-up (see section 4.4.29) and has persistent
3513 jobs, then it MUST change all of jobs' "time-at-xxx(integer)" (time tick) job attributes whose events have
3514 occurred either to:

- 3515 1. 0 to indicate that the event happened before the most recent power up OR
- 3516 2. the negative of the number of seconds before the most recent power-up that the event took place,
3517 though the negative number NEED NOT reflect the exact number of seconds.

3518 If a client queries a "time-at-xxx(integer)" time tick Job attribute and finds the value to be 0 or negative, the
3519 client MUST assume that the event occurred in some life other than the Printer's current life.

3520 Note: A Printer does not change the values of any "date-time-at-xxx(dateTime)" job attributes on power-up.

3521 4.3.14.1 time-at-creation (integer(MIN:MAX))

3522 This REQUIRED attribute indicates the time at which the Job object was created.

3523 4.3.14.2 time-at-processing (integer(MIN:MAX))

3524 This REQUIRED attribute indicates the time at which the Job object first began processing after the create
3525 operation or the most recent Restart-Job operation. The out-of-band 'no-value' value is returned if the job
3526 has not yet been in the 'processing' state (see the beginning of Section 4.1). **Issue 17**

3527 4.3.14.3 time-at-completed (integer(MIN:MAX))

3528 This REQUIRED attribute indicates the time at which the Job object completed (or was cancelled or
3529 aborted). The out-of-band 'no-value' value is returned if the job has not yet completed, been canceled, or
3530 aborted (see the beginning of Section 4.1).

3531 4.3.14.4 job-printer-up-time (integer(1:MAX)) **Issue 17**

3532 This REQUIRED Job Description attribute indicates the amount of time (in seconds) that the Printer
3533 implementation has been up and running. This attribute is an alias for the "printer-up-time" Printer
3534 Description attribute (see Section 4.4.29).

3535 A client MAY request this attribute in a Get-Job-Attributes or Get-Jobs request and use the value returned
3536 in combination with other requested Event Time Job Description Attributes in order to display time
3537 attributes to a user. The difference between this attribute and the 'integer' value of a "time-at-xxx" attribute
3538 is the number of seconds ago that the "time-at-xxx" event occurred. A client can compute the wall-clock
3539 time at which the "time-at-xxx" event occurred by subtracting this difference from the client's wall-clock
3540 time.

3541 4.3.12.5 date-time-at-creation (dateTime) **Issue 17**

3542 This attribute indicates the date and time at which the Job object was created.

3543 4.3.12.6 date-time-at-processing (dateTime) **Issue 17**

3544 This attribute indicates the date and time at which the Job object first began processing after the create
3545 operation or the most recent Restart-Job operation.

3546 4.3.12.7 date-time-at-completed (dateTime) **Issue 17**

3547 This attribute indicates the date and time at which the Job object completed (or was cancelled or aborted).

3548 4.3.15 number-of-intervening-jobs (integer(0:MAX))

3549 This attribute indicates the number of jobs that are "ahead" of this job in the relative chronological order of
3550 expected time to complete (i.e., the current scheduled order). For efficiency, it is only necessary to calculate
3551 this value when an operation is performed that requests this attribute.

3552 4.3.16 job-message-from-operator (text(127))

3553 This attribute provides a message from an operator, system administrator or "intelligent" process to indicate
3554 to the end user the reasons for modification or other management action taken on a job.

3555 4.3.17 Job Size Attributes

3556 This sub-section defines job attributes that describe the size of the job. These attributes are not intended to
3557 be counters; they are intended to be useful routing and scheduling information if known. For these
3558 attributes, the Printer object may try to compute the value if it is not supplied in the create request. Even if
3559 the client does supply a value for these three attributes in the create request, the Printer object MAY choose
3560 to change the value if the Printer object is able to compute a value which is more accurate than the client

3561 supplied value. The Printer object may be able to determine the correct value for these attributes either
3562 right at job submission time or at any later point in time.

3563 4.3.17.1 job-k-octets (integer(0:MAX))

3564 This attribute specifies the total size of the document(s) in K octets, i.e., in units of 1024 octets requested to
3565 be processed in the job. The value **MUST** be rounded up, so that a job between 1 and 1024 octets **MUST**
3566 be indicated as being 1, 1025 to 2048 **MUST** be 2, etc.

3567 This value **MUST NOT** include the multiplicative factors contributed by the number of copies specified by
3568 the "copies" attribute, independent of whether the device can process multiple copies without making
3569 multiple passes over the job or document data and independent of whether the output is collated or not.
3570 Thus the value is independent of the implementation and indicates the size of the document(s) measured in
3571 K octets independent of the number of copies.

3572 This value **MUST** also not include the multiplicative factor due to a copies instruction embedded in the
3573 document data. If the document data actually includes replications of the document data, this value will
3574 include such replication. In other words, this value is always the size of the source document data, rather
3575 than a measure of the hardcopy output to be produced.

3576 4.3.17.2 job-impressions (integer(0:MAX))

3577 This attribute specifies the total size in number of impressions of the document(s) being submitted (see the
3578 definition of impression in section 12.2.5).

3579 As with "job-k-octets", this value **MUST NOT** include the multiplicative factors contributed by the number
3580 of copies specified by the "copies" attribute, independent of whether the device can process multiple copies
3581 without making multiple passes over the job or document data and independent of whether the output is
3582 collated or not. Thus the value is independent of the implementation and reflects the size of the
3583 document(s) measured in impressions independent of the number of copies.

3584 As with "job-k-octets", this value **MUST** also not include the multiplicative factor due to a copies
3585 instruction embedded in the document data. If the document data actually includes replications of the
3586 document data, this value will include such replication. In other words, this value is always the number of
3587 impressions in the source document data, rather than a measure of the number of impressions to be
3588 produced by the job.

3589 4.3.17.3 job-media-sheets (integer(0:MAX))

3590 This attribute specifies the total number of media sheets to be produced for this job.

3591 Unlike the "job-k-octets" and the "job-impressions" attributes, this value **MUST** include the multiplicative
3592 factors contributed by the number of copies specified by the "copies" attribute and a 'number of copies'
3593 instruction embedded in the document data, if any. This difference allows the system administrator to
3594 control the lower and upper bounds of both (1) the size of the document(s) with "job-k-octets-supported"
3595 and "job-impressions-supported" and (2) the size of the job with "job-media-sheets-supported".

3596 4.3.18 Job Progress Attributes

3597 This sub-section defines job attributes that describe the progress of the job. These attributes are intended to
3598 be counters. That is, the value for a job that has not started processing **MUST** be 0. When the job's "job-
3599 state" is 'processing' or 'processing-stopped', this value is intended to contain the amount of the job that has
3600 been processed to the time at which the attributes are requested. When the job enters the 'completed',
3601 'canceled', or 'aborted' states, these values are the final values for the job.

3602 4.3.18.1 job-k-octets-processed (integer(0:MAX))

3603 This attribute specifies the total number of octets processed in K octets, i.e., in units of 1024 octets so far.
3604 The value **MUST** be rounded up, so that a job between 1 and 1024 octets inclusive **MUST** be indicated as
3605 being 1, 1025 to 2048 inclusive **MUST** be 2, etc.

3606 For implementations where multiple copies are produced by the interpreter with only a single pass over the
3607 data, the final value **MUST** be equal to the value of the "job-k-octets" attribute. For implementations where
3608 multiple copies are produced by the interpreter by processing the data for each copy, the final value **MUST**
3609 be a multiple of the value of the "job-k-octets" attribute.

3610 4.3.18.2 job-impressions-completed (integer(0:MAX))

3611 This job attribute specifies the number of impressions completed for the job so far. For printing devices,
3612 the impressions completed includes interpreting, marking, and stacking the output.

3613 4.3.18.3 job-media-sheets-completed (integer(0:MAX))

3614 This job attribute specifies the media-sheets completed marking and stacking for the entire job so far
3615 whether those sheets have been processed on one side or on both.

3616 4.3.19 attributes-charset (charset)

3617 This **REQUIRED** attribute is populated using the value in the client supplied "attributes-charset" attribute in
3618 the create request. It identifies the charset (coded character set and encoding method) used by any Job
3619 attributes with attribute syntax 'text' and 'name' that were supplied by the client in the create request. See
3620 Section 3.1.4 for a complete description of the "attributes-charset" operation attribute.

3621 This attribute does not indicate the charset in which the 'text' and 'name' values are stored internally in the
3622 Job object. The internal charset is implementation-defined. The IPP object **MUST** convert from whatever
3623 the internal charset is to that being requested in an operation as specified in Section 3.1.4.

3624 4.3.20 attributes-natural-language (naturalLanguage)

3625 This **REQUIRED** attribute is populated using the value in the client supplied "attributes-natural-language"
3626 attribute in the create request. It identifies the natural language used for any Job attributes with attribute
3627 syntax 'text' and 'name' that were supplied by the client in the create request. See Section 3.1.4 for a

3628 complete description of the "attributes-natural-language" operation attribute. See Sections 4.1.1.2 and
3629 4.1.2.2 for how a Natural Language Override may be supplied explicitly for each 'text' and 'name' attribute
3630 value that differs from the value identified by the "attributes-natural-language" attribute.

3631 4.4 Printer Description Attributes

3632 These attributes form the attribute group called "printer-description". The following table summarizes
3633 these attributes, their syntax, and whether or not they are REQUIRED for a Printer object to support. If
3634 they are not indicated as REQUIRED, they are OPTIONAL. The maximum size in octets for 'text' and
3635 'name' attributes is indicated in parentheses.

3636 Note: How these attributes are set by an Administrator is outside the scope of this IPP/1.1 document.

3720	

3721 4.4.1 printer-uri-supported (1setOf uri)

3722 This REQUIRED Printer attribute contains at least one URI for the Printer object. It OPTIONALLY
 3723 contains more than one URI for the Printer object. An administrator determines a Printer object's URI(s)
 3724 and configures this attribute to contain those URIs by some means outside the scope of this IPP/1.1
 3725 document. The precise format of this URI is implementation dependent and depends on the protocol. See
 3726 the next two sections for a description of the "uri-security-supported" and "uri-authentication-supported"
 3727 attributes, both of which are the REQUIRED companion attributes to this "printer-uri-supported" attribute.
 3728 See section 2.4 on Printer object identity and section 8.2 on security and URIs for more information.

3729 4.4.2 uri-authentication-supported (1setOf type2 keyword) **Issue 2**

3730 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values) as
 3731 the "printer-uri-supported" attribute. This attribute identifies the Client Authentication mechanism

3732 associated with each URI listed in the "printer-uri-supported" attribute. The Printer object uses the specified
3733 mechanism to identify the authenticated user (see section 8.3) . The "i th" value in "uri-authentication-
3734 supported" corresponds to the "i th" value in "printer-uri-supported" and it describes the authentication
3735 mechanisms used by the Printer when accessed via that URI. See [IPP-PRO] for more details on Client
3736 Authentication.

3737 The following standard keyword values are defined:

3738 'none': There is no authentication mechanism associated with the URI. The Printer object assumes that
3739 the authenticated user is "anonymous".
3740 'requesting-user-name': When a client performs an operation whose target is the associated URI, the
3741 Printer object assumes that the authenticated user is specified by the "requesting-user-name"
3742 Operation attribute (see section 8.3). If the "requesting-user-name" attribute is absent in a request,
3743 the Printer object assumes that the authenticated user is "anonymous".
3744 'basic': When a client performs an operation whose target is the associated URI, the Printer object
3745 challenges the client with HTTP basic authentication. The Printer object assumes that the
3746 authenticated user is the name received via the basic authentication mechanism.
3747 'digest': When a client performs an operation whose target is the associated URI, the Printer object
3748 challenges the client with HTTP digest authentication. The Printer object assumes that the
3749 authenticated user is the name received via the digest authentication mechanism.
3750 'certificate': When a client performs an operation whose target is the associated URI, the Printer object
3751 expects the client to provide a certificate. The Printer object assumes that the authenticated user is
3752 the textual name contained within the certificate.

3753 4.4.3 uri-security-supported (1setOf type2 keyword)

3754 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values) as
3755 the "printer-uri-supported" attribute. This attribute identifies the security mechanisms used for each URI
3756 listed in the "printer-uri-supported" attribute. The "i th" value in "uri-security-supported" corresponds to
3757 the "i th" value in "printer-uri-supported" and it describes the security mechanisms used for accessing the
3758 Printer object via that URI. See [IPP-PRO] for more details on security mechanisms.

3759 The following standard keyword values are defined:

3760 'none': There are no secure communication channel protocols in use for the given URI.
3761 'ssl3': SSL3 [SSL] is the secure communications channel protocol in use for the given URI.
3762 'tls': TLS [RFC2246] is the secure communications channel protocol in use for the given URI.
3763

3764 This attribute is orthogonal to the definition of a Client Authentication mechanism. Specifically, 'none'
3765 does not exclude Client Authentication. See section 4.4.2. [Issue 21](#)

3766 Consider the following example. For a single Printer object, an administrator configures the "printer-uri-
3767 supported", "uri-authentication-supported" and "uri-security-supported" attributes as follows:

3768 "printer-uri-supported": 'xxx://acme.com/open-use-printer', 'xxx://acme.com/restricted-use-printer',
3769 'xxx://acme.com/private-printer'
3770 "uri-authentication-supported": 'none', 'digest', 'basic'

3771 "uri-security-supported": 'none', 'none', 'tls'
3772

3773 Note: 'xxx' is not a valid scheme. See the IPP/1.1 "Transport and Encoding" document [IPP-PRO] for the
3774 actual URI schemes to be used in object target attributes.

3775 In this case, one Printer object has three URIs.

- 3776 - For the first URI, 'xxx://acme.com/open-use-printer', the value 'none' in "uri-security-supported"
3777 indicates that there is no secure channel protocol configured to run under HTTP. The value of 'none'
3778 in "uri-authentication-supported" indicates that all users are 'anonymous'. There will be no
3779 challenge and the Printer will ignore "requesting-user-name".
- 3780 - For the second URI, 'xxx://acme.com/restricted-use-printer', the value 'none' in "uri-security-
3781 supported" indicates that there is no secure channel protocol configured to run under HTTP. The
3782 value of 'digest' in "uri-authentication-supported" indicates that the Printer will issue a challenge and
3783 that the Printer will use the name supplied by the digest mechanism to determine the authenticated
3784 user (see section 8.3).
- 3785 - For the third URI, 'xxx://acme.com/private-printer', the value 'ssl3' the value 'tls' in "uri-security-
3786 supported" indicates that TLS is being used to secure the channel. The client SHOULD be prepared
3787 to use TLS framing to negotiate an acceptable ciphersuite to use while communicating with the
3788 Printer object. In this case, the name implies the use of a secure communications channel, but the
3789 fact is made explicit by the presence of the 'tls' value in "uri-security-supported". The client does
3790 not need to resort to understanding which security it must use by following naming conventions or
3791 by parsing the URI to determine which security mechanisms are implied. The value of 'basic' in "uri-
3792 authentication-supported" indicates that the Printer will issue a challenge and that the Printer will
3793 use the name supplied by the digest mechanism to determine the authenticated user (see section 8.3)
3794 . Because this challenge occurs in a tls session, the channel is secure.
3795

3796 It is expected that many IPP Printer objects will be configured to support only one channel (either
3797 configured to use TLS access or not) and only one authentication mechanism. Such Printer objects only
3798 have one URI listed in the "printer-uri-supported" attribute. No matter the configuration of the Printer
3799 object (whether it has only one URI or more than one URI), a client MUST supply only one URI in the
3800 target "printer-uri" operation attribute.

3801 4.4.4 printer-name (name(127))

3802 This REQUIRED Printer attribute contains the name of the Printer object. It is a name that is more end-
3803 user friendly than a URI. An administrator determines a printer's name and sets this attribute to that name.
3804 This name may be the last part of the printer's URI or it may be unrelated. In non-US-English locales, a
3805 name may contain characters that are not allowed in a URI.

3806 4.4.5 printer-location (text(127))

3807 This Printer attribute identifies the location of the device. This could include things like: "in Room 123A,
3808 second floor of building XYZ".

3809 4.4.6 printer-info (text(127))

3810 This Printer attribute identifies the descriptive information about this Printer object. This could include
3811 things like: "This printer can be used for printing color transparencies for HR presentations", or "Out of
3812 courtesy for others, please print only small (1-5 page) jobs at this printer", or even "This printer is going
3813 away on July 1, 1997, please find a new printer".

3814 4.4.7 printer-more-info (uri)

3815 This Printer attribute contains a URI used to obtain more information about this specific Printer object. For
3816 example, this could be an HTTP type URI referencing an HTML page accessible to a Web Browser. The
3817 information obtained from this URI is intended for end user consumption. Features outside the scope of IPP
3818 can be accessed from this URI. The information is intended to be specific to this printer instance and site
3819 specific services (e.g. job pricing, services offered, end user assistance). The device manufacturer may
3820 initially populate this attribute.

3821 4.4.8 printer-driver-installer (uri)

3822 This Printer attribute contains a URI to use to locate the driver installer for this Printer object. This
3823 attribute is intended for consumption by automata. The mechanics of print driver installation is outside the
3824 scope of this IPP/1.1 document. The device manufacturer may initially populate this attribute.

3825 4.4.9 printer-make-and-model (text(127))

3826 This Printer attribute identifies the make and model of the device. The device manufacturer may initially
3827 populate this attribute.

3828 4.4.10 printer-more-info-manufacturer (uri)

3829 This Printer attribute contains a URI used to obtain more information about this type of device. The
3830 information obtained from this URI is intended for end user consumption. Features outside the scope of
3831 IPP can be accessed from this URI (e.g., latest firmware, upgrades, print drivers, optional features available,
3832 details on color support). The information is intended to be germane to this printer without regard to site
3833 specific modifications or services. The device manufacturer may initially populate this attribute.

3834 4.4.11 printer-state (type1 enum)

3835 This REQUIRED Printer attribute identifies the current state of the device. The "printer-state reasons"
3836 attribute augments the "printer-state" attribute to give more detailed information about the Printer in the
3837 given printer state.

3838 A Printer object need only update this attribute before responding to an operation which requests the
3839 attribute; the Printer object NEED NOT update this attribute continually, since asynchronous event
3840 notification is not part of IPP/1.1. A Printer NEED NOT implement all values if they are not applicable to
3841 a given implementation.

3842 The following standard enum values are defined:

3843	Value	Symbolic Name and Description
3844		
3845	'3'	'idle': Indicates that new jobs can start processing without waiting. Issue 31
3846	'4'	'processing': Indicates that jobs are processing; new jobs will wait before processing. Issue
3847		31
3848	'5'	'stopped': Indicates that no jobs can be processed and intervention is
3849		required. Issue 31

3850 Values of "printer-state-reasons", such as 'spool-area-full' and 'stopped-partly', MAY be used to provide
3851 further information. Issue 31

3852 4.4.12 printer-state-reasons (1setOf type2 keyword)

3853 This REQUIRED Printer attribute supplies additional detail about the device's state. Some of the these
3854 value definitions indicate conformance requirements; the rest are OPTIONAL. Issue 30

3855 Each keyword value MAY have a suffix to indicate its level of severity. The three levels are: report (least
3856 severe), warning, and error (most severe).

- 3857 - 'report': This suffix indicates that the reason is a "report". An implementation may choose to omit
3858 some or all reports. Some reports specify finer granularity about the printer state; others serve as a
3859 precursor to a warning. A report MUST contain nothing that could affect the printed output.
- 3860 - 'warning': This suffix indicates that the reason is a "warning". An implementation may choose to omit
3861 some or all warnings. Warnings serve as a precursor to an error. A warning MUST contain nothing
3862 that prevents a job from completing, though in some cases the output may be of lower quality.
- 3863 - 'error': This suffix indicates that the reason is an "error". An implementation MUST include all
3864 errors. If this attribute contains one or more errors, printer MUST be in the stopped state.
3865

3866 If the implementation does not add any one of the three suffixes, all parties MUST assume that the reason is
3867 an "error".

3868 If a Printer object controls more than one output device, each value of this attribute MAY apply to one or
3869 more of the output devices. An error on one output device that does not stop the Printer object as a whole
3870 MAY appear as a warning in the Printer's "printer-state-reasons attribute". If the "printer-state" for such a
3871 Printer has a value of 'stopped', then there MUST be an error reason among the values in the "printer-state-
3872 reasons" attribute.

3873 The following standard keyword values are defined:

- 3874 'other': The device has detected an error other than one listed in this document.
- 3875 'none': There are not reasons. This state reason is semantically equivalent to "printer-state-reasons"
3876 without any value and MUST be used, since the 1setOf attribute syntax requires at least one value.
- 3877 'media-needed': A tray has run out of media.
- 3878 'media-jam': The device has a media jam.

- 3879 'moving-to-paused': Someone has paused the Printer object using the Pause-Printer operation (see
3880 section 3.2.7) or other means, but the device(s) are taking an appreciable time to stop. Later, when
3881 all output has stopped, the "printer-state" becomes 'stopped', and the 'paused' value replaces the
3882 'moving-to-paused' value in the "printer-state-reasons" attribute. This value MUST be supported, if
3883 the Pause-Printer operation is supported and the implementation takes significant time to pause a
3884 device in certain circumstances. **Issue 30**
- 3885 'paused': Someone has paused the Printer object using the Pause-Printer operation (see section 3.2.7) or
3886 other means and the Printer object's "printer-state" is 'stopped'. In this state, a Printer MUST NOT
3887 produce printed output, but it MUST perform other operations requested by a client. If a Printer had
3888 been printing a job when the Printer was paused, the Printer MUST resume printing that job when
3889 the Printer is no longer paused and leave no evidence in the printed output of such a pause. This
3890 value MUST be supported, if the Pause-Printer operation is supported. **Issue 30**
- 3891 'shutdown': Someone has removed a Printer object from service, and the device may be powered down
3892 or physically removed. In this state, a Printer object MUST NOT produce printed output, and unless
3893 the Printer object is realized by a print server that is still active, the Printer object MUST perform no
3894 other operations requested by a client, including returning this value. If a Printer object had been
3895 printing a job when it was shutdown, the Printer NEED NOT resume printing that job when the
3896 Printer is no longer shutdown. If the Printer resumes printing such a job, it may leave evidence in
3897 the printed output of such a shutdown, e.g. the part printed before the shutdown may be printed a
3898 second time after the shutdown.
- 3899 'connecting-to-device': The Printer object has scheduled a job on the output device and is in the process
3900 of connecting to a shared network output device (and might not be able to actually start printing the
3901 job for an arbitrarily long time depending on the usage of the output device by other servers on the
3902 network).
- 3903 'timed-out': The server was able to connect to the output device (or is always connected), but was unable
3904 to get a response from the output device.
- 3905 'stopping': The Printer object is in the process of stopping the device and will be stopped in a while.
3906 When the device is stopped, the Printer object will change the Printer object's state to 'stopped'. The
3907 'stopping-warning' reason is never an error, even for a Printer with a single output device. When an
3908 output-device ceases accepting jobs, the Printer will have this reason while the output device
3909 completes printing.
- 3910 'stopped-partly': When a Printer object controls more than one output device, this reason indicates that
3911 one or more output devices are stopped. If the reason is a report, fewer than half of the output
3912 devices are stopped. If the reason is a warning, fewer than all of the output devices are stopped.
- 3913 'toner-low': The device is low on toner.
- 3914 'toner-empty': The device is out of toner.
- 3915 'spool-area-full': The limit of persistent storage allocated for spooling has been reached. The Printer is
3916 temporarily unable to accept more jobs. The Printer will remove this value when it is able to accept
3917 more jobs. This value SHOULD be used by a non-spooling Printer that only accepts one or a small
3918 number jobs at a time or a spooling Printer that has filled the spool space. **Issue 20 Issue 30 and**
3919 **Issue 31**
- 3920 'cover-open': One or more covers on the device are open.
- 3921 'interlock-open': One or more interlock devices on the printer are unlocked.
- 3922 'door-open': One or more doors on the device are open.
- 3923 'input-tray-missing': One or more input trays are not in the device.

3924 'media-low': At least one input tray is low on media.
3925 'media-empty': At least one input tray is empty.
3926 'output-tray-missing': One or more output trays are not in the device
3927 'output-area-almost-full': One or more output area is almost full (e.g. tray, stacker, collator).
3928 'output-area-full': One or more output area is full. (e.g. tray, stacker, collator)
3929 'marker-supply-low': The device is low on at least one marker supply. (e.g. toner, ink, ribbon)
3930 'marker-supply-empty': The device is out of at least one marker supply. (e.g. toner, ink, ribbon)
3931 'marker-waste-almost-full': The device marker supply waste receptacle is almost full.
3932 'marker-waste-full': The device marker supply waste receptacle is full.
3933 'fuser-over-temp': The fuser temperature is above normal.
3934 'fuser-under-temp': The fuser temperature is below normal.
3935 'opc-near-eol': The optical photo conductor is near end of life.
3936 'opc-life-over': The optical photo conductor is no longer functioning.
3937 'developer-low': The device is low on developer.
3938 'developer-empty': The device is out of developer.
3939 'interpreter-resource-unavailable': An interpreter resource is unavailable (i.e. font, form)
3940

3941 4.4.13 printer-state-message (text(MAX))

3942 This Printer attribute specifies the additional information about the printer state and printer state reasons in
3943 human readable text. If the Printer object supports this attribute, the Printer object **MUST** be able to
3944 generate this message in any of the natural languages identified by the Printer's "generated-natural-
3945 language-supported" attribute (see the "attributes-natural-language" operation attribute specified in Section
3946 3.1.4.1).

3947 4.4.14 ipp-versions-supported (1setOf type2 keyword) **Issue 36**

3948 This **REQUIRED** attribute identifies the IPP protocol version(s) that this Printer supports, including major
3949 and minor versions, i.e., the version numbers for which this Printer implementation meets the conformance
3950 requirements. For version number validation, the Printer matches the (two-octet binary) "version-number"
3951 parameter supplied by the client in each request (see sections 3.1.1 and 3.1.8) with the (US-ASCII) keyword
3952 values of this attribute.

3953 The following standard keyword values are defined:

3954 '1.0': Meets the conformance requirement of IPP version 1.0 as specified in RFC 2566 [RFC2566] and
3955 RFC 2565 [RFC2565] including any extensions registered according to Section 6 and any extension
3956 defined in this version or any future version of the IPP "Model and Semantics" document or the IPP
3957 "Encoding and Transport" document following the rules, if any, when the "version-number"
3958 parameter is '1.0'.
3959 '1.1': Meets the conformance requirement of IPP version 1.1 as specified in this document and [IPP-
3960 PRO] including any extensions registered according to Section 6 and any extension defined in any
3961 future versions of the IPP "Model and Semantics" document or the IPP Encoding and Transport
3962 document following the rules, if any, when the "version-number" parameter is '1.1'.

3963 4.4.15 operations-supported (1setOf type2 enum)

3964 This REQUIRED Printer attribute specifies the set of supported operations for this Printer object and
3965 contained Job objects.

3966 This attribute is encoded as any other enum attribute syntax according to [IPP-PRO] as 32-bits. However,
3967 all 32-bit enum values for this attribute MUST NOT exceed 0x00008FFF, since these same values are also
3968 passed in two octets in the "operation-id" parameter (see section 3.1.1) in each Protocol request with the
3969 two high order octets omitted in order to indicate the operation being performed [IPP-PRO].

3970 The following standard enum and "operation-id" (see section 3.1.2) values are defined:

3971	Value	Operation Name
3972	-----	-----
3973		
3974	0x0000	reserved, not used
3975	0x0001	reserved, not used
3976	0x0002	Print-Job
3977	0x0003	Print-URI
3978	0x0004	Validate-Job
3979	0x0005	Create-Job
3980	0x0006	Send-Document
3981	0x0007	Send-URI
3982	0x0008	Cancel-Job
3983	0x0009	Get-Job-Attributes
3984	0x000A	Get-Jobs
3985	0x000B	Get-Printer-Attributes
3986	0x000C	Hold-Job
3987	0x000D	Release-Job
3988	0x000E	Restart-Job
3989	0x000F	reserved for a future operation
3990	0x0010	Pause-Printer
3991	0x0011	Resume-Printer
3992	0x0012	Purge-Jobs
3993	0x0013-0x3FFF	reserved for future operations
3994	0x4000-0x8FFF	reserved for private extensions

3995

3996 The reserved block for private extensions allows for vendors to implement private extensions that are
3997 guaranteed to not conflict with future registered extensions. However, there is no guarantee that two or
3998 more private extensions will not conflict.

3999 4.4.16 multiple-document-jobs-supported (boolean) **Issue 34**

4000 This Printer attribute indicates whether or not the Printer supports more than one document per job, i.e.,
4001 more than one Send-Document or Send-Data operation with document data. If the Printer supports the
4002 Create-Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

4003 4.4.17 charset-configured (charset)

4004 This REQUIRED Printer attribute identifies the charset that the Printer object has been configured to
4005 represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or
4006 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-
4007 make-and-model" (text). Therefore, the value of the Printer object's "charset-configured" attribute MUST
4008 also be among the values of the Printer object's "charset-supported" attribute.

4009 4.4.18 charset-supported (1setOf charset)

4010 This REQUIRED Printer attribute identifies the set of charsets that the Printer and contained Job objects
4011 support in attributes with attribute syntax 'text' and 'name'. At least the value 'utf-8' MUST be present, since
4012 IPP objects MUST support the UTF-8 [RFC2279] charset. If a Printer object supports a charset, it means
4013 that for all attributes of syntax 'text' and 'name' the IPP object MUST (1) accept the charset in requests and
4014 return the charset in responses as needed.

4015 If more charsets than UTF-8 are supported, the IPP object MUST perform charset conversion between the
4016 charsets as described in Section 3.1.4.2.

4017 4.4.19 natural-language-configured (naturalLanguage)

4018 This REQUIRED Printer attribute identifies the natural language that the Printer object has been configured
4019 to represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or
4020 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-
4021 make-and-model" (text). When returning these Printer attributes, the Printer object MAY return them in the
4022 configured natural language specified by this attribute, instead of the natural language requested by the
4023 client in the "attributes-natural-language" operation attribute. See Section 3.1.4.1 for the specification of
4024 the OPTIONAL multiple natural language support. Therefore, the value of the Printer object's "natural-
4025 language-configured" attribute MUST also be among the values of the Printer object's "generated-natural-
4026 language-supported" attribute.

4027 4.4.20 generated-natural-language-supported (1setOf naturalLanguage)

4028 This REQUIRED Printer attribute identifies the natural language(s) that the Printer object and contained
4029 Job objects support in attributes with attribute syntax 'text' and 'name'. The natural language(s) supported
4030 depends on implementation and/or configuration. Unlike charsets, IPP objects MUST accept requests with
4031 any natural language or any Natural Language Override whether the natural language is supported or not.

4032 If a Printer object supports a natural language, it means that for any of the attributes for which the Printer or
4033 Job object generates messages, i.e., for the "job-state-message" and "printer-state-message" attributes and
4034 Operation Messages (see Section 3.1.5) in operation responses, the Printer and Job objects MUST be able
4035 to generate messages in any of the Printer's supported natural languages. See section 3.1.4 for the definition
4036 of 'text' and 'name' attributes in operation requests and responses.

4037 Note: A Printer object that supports multiple natural languages, often has separate catalogs of messages,
4038 one for each natural language supported.

4039 4.4.21 document-format-default (mimeMediaType)

4040 This REQUIRED Printer attribute identifies the document format that the Printer object has been
4041 configured to assume if the client does not supply a "document-format" operation attribute in any of the
4042 operation requests that supply document data. The standard values for this attribute are Internet Media
4043 types (sometimes called MIME types). For further details see the description of the 'mimeMediaType'
4044 attribute syntax in Section 4.1.9.

4045 4.4.22 document-format-supported (1setOf mimeMediaType)

4046 This REQUIRED Printer attribute identifies the set of document formats that the Printer object and
4047 contained Job objects can support. For further details see the description of the 'mimeMediaType' attribute
4048 syntax in Section 4.1.9.

4049 4.4.23 printer-is-accepting-jobs (boolean)

4050 This REQUIRED Printer attribute indicates whether the printer is currently able to accept jobs, i.e., is
4051 accepting Print-Job, Print-URI, and Create-Job requests. If the value is 'true', the printer is accepting jobs.
4052 If the value is 'false', the Printer object is currently rejecting any jobs submitted to it. In this case, the
4053 Printer object returns the 'server-error-not-accepting-jobs' status code.

4054 This value is independent of the "printer-state" and "printer-state-reasons" attributes because its value does
4055 not affect the current job; rather it affects future jobs. This attribute, when 'false', causes the Printer to
4056 reject jobs even when the "printer-state" is 'idle' or, when 'true', causes the Printer object to accept jobs
4057 even when the "printer-state" is 'stopped'.

4058 4.4.24 queued-job-count (integer(0:MAX))

4059 This REQUIRED Printer attribute contains a count of the number of jobs that are either 'pending',
4060 'processing', 'pending-held', or 'processing-stopped' and is set by the Printer object. **Issue 29**

4061 4.4.25 printer-message-from-operator (text(127))

4062 This Printer attribute provides a message from an operator, system administrator or "intelligent" process to
4063 indicate to the end user information or status of the printer, such as why it is unavailable or when it is
4064 expected to be available.

4065 4.4.26 color-supported (boolean)

4066 This Printer attribute identifies whether the device is capable of any type of color printing at all, including
4067 highlight color. All document instructions having to do with color are embedded within the document PDL
4068 (none are external IPP attributes in IPP/1.1).

4069 Note: end-users are able to determine the nature and details of the color support by querying the "printer-
4070 more-info-manufacturer" Printer attribute.

4071 4.4.27 reference-uri-schemes-supported (1setOf uriScheme)

4072 This Printer attribute specifies which URI schemes are supported for use in the "document-uri" operation
4073 attribute of the Print-URI or Send-URI operation. If a Printer object supports these optional operations, it
4074 MUST support the "reference-uri-schemes-supported" Printer attribute with at least the following schemed
4075 URI value:

4076 'ftp': The Printer object will use an FTP 'get' operation as defined in RFC 2228 [RFC2228] using FTP
4077 URLs as defined by [RFC2396] and[RFC2316].
4078

4079 The Printer object MAY OPTIONALLY support other URI schemes (see section 4.1.6).

4080 4.4.28 pdl-override-supported (type2 keyword)

4081 This REQUIRED Printer attribute expresses the ability for a particular Printer implementation to either
4082 attempt to override document data instructions with IPP attributes or not.

4083 This attribute takes on the following values:

- 4084 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values take
4085 precedence over embedded instructions in the document data, however there is no guarantee.
- 4086 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP attribute
4087 values take precedence over embedded instructions in the document data.
4088

4089 Section 15 contains a full description of how this attribute interacts with and affects other IPP attributes,
4090 especially the "ipp-attribute-fidelity" attribute.

4091 4.4.29 printer-up-time (integer(1:MAX))

4092 This REQUIRED Printer attribute indicates the amount of time (in seconds) that this Printer instance has
4093 been up and running. The value is a monotonically increasing value starting from 1 when the Printer object
4094 is started-up (initialized, booted, etc.). This value is used to populate the Event Time Job Description Job
4095 attributes "time-at-creation", "time-at-processing", and "time-at-completed" (see section 4.3.14).

4096 If the Printer object goes down at some value 'n', and comes back up, the implementation MAY:

- 4097 1. Know how long it has been down, and resume at some value greater than 'n', or
- 4098 2. Restart from 1.

4099 In other words, if the device or devices that the Printer object is representing are restarted or power cycled,
4100 the Printer object MAY continue counting this value or MAY reset this value to 1 depending on
4101 implementation. However, if the Printer object software ceases running, and restarts without knowing the
4102 last value for "printer-up-time", the implementation MUST reset this value to 1. If this value is reset and
4103 the Printer has persistent jobs, the Printer MUST reset the "time-at-xxx(integer) Event Time Job
4104 Description attributes according to Section 4.3.14. **Issue 17** An implementation MAY use both
4105 implementation alternatives, depending on warm versus cold start, respectively.

4106 4.4.30 printer-current-time (dateTime)

4107 This Printer attribute indicates the current date and time. This value is used to populate the Event Time Job
4108 Description attributes: "time-at-creation", "time-at-processing", and "time-at-completed" (see Section
4109 4.3.14). The date and time is obtained on a "best efforts basis" and does not have to be that precise in order
4110 to work in practice. A Printer implementation sets the value of this attribute by obtaining the date and time
4111 via some implementation-dependent means, such as getting the value from a network time server,
4112 initialization at time of manufacture, or setting by an administrator. See [IPP-IIG] for examples. If an
4113 implementation supports this attribute and the implementation knows that it has not yet been set, then the
4114 implementation MUST return the value of this attribute using the out-of-band 'no-value' meaning not
4115 configured. See the beginning of section 4.1. **Issue 17**

4116 The time zone of this attribute NEED NOT be the time zone used by people located near the Printer object
4117 or device. The client MUST NOT expect that the time zone of any received 'dateTime' value to be in the
4118 time zone of the client or in the time zone of the people located near the printer. **Issue 17**

4119 The client SHOULD display any dateTime attributes to the user in client local time by converting the
4120 'dateTime' value returned by the server to the time zone of the client, rather than using the time zone
4121 returned by the Printer in attributes that use the 'dateTime' attribute syntax. **Issue 17**

4122 4.4.31 multiple-operation-time-out (integer(1:MAX))

4123 This Printer attributes identifies the minimum time (in seconds) that the Printer object waits for additional
4124 Send-Document or Send-URI operations to follow a still-open multi-document Job object before taking
4125 any recovery actions, such as the ones indicated in section 3.3.1. If the Printer object supports the Create-
4126 Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

4127 It is RECOMMENDED that vendors supply a value for this attribute that is between 60 and 240 seconds.
4128 An implementation MAY allow a system administrator to set this attribute (by means outside this IPP/1.1
4129 document). If so, the system administrator MAY be able to set values outside this range.

4130 4.4.32 compression-supported (1setOf type3 keyword)

4131 This REQUIRED Printer attribute identifies the set of supported compression algorithms for document
4132 data. Compression only applies to the document data; compression does not apply to the encoding of the
4133 IPP operation itself. The supported values are used to validate the client supplied "compression" operation
4134 attributes in Print-Job, Send-Document, and Send-URI requests. **Issue 28**

4135 Standard values are :

4136 'none': no compression is used.
4137 'deflate': ZIP public domain inflate/deflate) compression technology
4138 'gzip' GNU zip compression technology described in RFC 1952 [RFC1952].
4139 'compress': UNIX compression technology
4140

4141 4.4.33 job-k-octets-supported (rangeOfInteger(0:MAX))

4142 This Printer attribute specifies the upper and lower bounds of total sizes of jobs in K octets, i.e., in units of
4143 1024 octets. The supported values are used to validate the client supplied "job-k-octets" operation attributes
4144 in create requests. The corresponding job description attribute "job-k-octets" is defined in section 4.3.17.1.

4145 4.4.34 job-impressions-supported (rangeOfInteger(0:MAX))

4146 This Printer attribute specifies the upper and lower bounds for the number of impressions per job. The
4147 supported values are used to validate the client supplied "job-impressions" operation attributes in create
4148 requests. The corresponding job description attribute "job-impressions" is defined in section 4.3.17.2.

4149 4.4.35 job-media-sheets-supported (rangeOfInteger(0:MAX))

4150 This Printer attribute specifies the upper and lower bounds for the number of media sheets per job. The
4151 supported values are used to validate the client supplied "job-media-sheets" operation attributes in create
4152 requests. The corresponding Job attribute "job-media-sheets" is defined in section 4.3.17.3.

4153 4.4.36 pages-per-minute (integer(0:MAX))

4154 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number which
4155 may be generated by this printer (e.g., simplex, black-and-white). This attribute is informative, not a
4156 service guarantee. Generally, it is the value used in the marketing literature to describe the device.

4157 A value of 0 indicates a device that takes more than two minutes to process a page.

4158 4.4.37 pages-per-minute-color (integer(0:MAX))

4159 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number which
4160 may be generated by this printer when printing color (e.g., simplex, color). For purposes of this attribute,
4161 "color" means the same as for the "color-supported" attribute, namely, the device is capable of any type of
4162 color printing at all, including highlight color. This attribute is informative, not a service guarantee.
4163 Generally, it is the value used in the marketing literature to describe the color capabilities of this device.

4164 A value of 0 indicates a device that takes more than two minutes to process a page.

4165 If a color device has several color modes, it MAY use the pages-per-minute value for this attribute that
4166 corresponds to the mode that produces the highest number.

4167 Black and white only printers MUST NOT support this attribute. If this attribute is present, then the "color-
4168 supported" Printer description attribute MUST be present and have a 'true' value.

4169 The values of these two attributes returned by the Get-Printer-Attributes operation MAY be affected by the
4170 "document-format" attribute supplied by the client in the Get-Printer-Attributes request. In other words, the
4171 implementation MAY have different speeds depending on the document format being processed. See
4172 section 3.2.5.1 Get-Printer-Attributes.

4173 5. Conformance

4174 This section describes conformance issues and requirements. This document introduces model entities such
4175 as objects, operations, attributes, attribute syntaxes, and attribute values. These conformance sections
4176 describe the conformance requirements which apply to these model entities.

4177 5.1 Client Conformance Requirements

4178 This section describes the conformance requirements for a client (see section 2.1), whether it be:

- 4179 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an
4180 application that sends IPP requests or
- 4181 2. the print server component that sends IPP requests to either an output device or another
4182 "downstream" print server. **Issue 4**

4183 A conforming client **MUST** support all **REQUIRED** operations as defined in this document. For each
4184 attribute included in an operation request, a conforming client **MUST** supply a value whose type and value
4185 syntax conforms to the requirements of the Model document as specified in Sections 3 and 4. A
4186 conforming client **MAY** supply any registered extensions and/or private extensions in an operation request,
4187 as long as they meet the requirements in Section 6.

4188 Otherwise, there are no conformance requirements placed on the user interfaces provided by IPP clients or
4189 their applications. For example, one application might not allow an end user to submit multiple documents
4190 per job, while another does. One application might first query a Printer object in order to supply a graphical
4191 user interface (GUI) dialogue box with supported and default values whereas a different implementation
4192 might not.

4193 When sending a request, an IPP client **NEED NOT** supply any attributes that are indicated as
4194 **OPTIONALLY** supplied by the client.

4195 A client **MUST** be able to accept any of the attribute syntaxes defined in Section 4.1, including their full
4196 range, that may be returned to it in a response from a Printer object. In particular for each attribute that the
4197 client supports whose attribute syntax is 'text', the client **MUST** accept and process both the
4198 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the client supports
4199 whose attribute syntax is 'name', the client **MUST** accept and process both the 'nameWithoutLanguage' and
4200 'nameWithLanguage' forms. For presentation purposes, truncation of long attribute values is not
4201 recommended. A recommended approach would be for the client implementation to allow the user to scroll
4202 through long attribute values.

4203 A response **MAY** contain attribute groups, attributes, attribute syntaxes, values, and status codes that the
4204 client does not expect. Therefore, a client implementation **MUST** gracefully handle such responses and not
4205 refuse to inter-operate with a conforming Printer that is returning registered or private extensions, including
4206 attribute groups, attributes, attribute syntaxes, attribute values, and status codes that conform to Section 6.
4207 Clients may choose to ignore any parameters, attributes, attribute syntaxes, or values that they do not
4208 understand. **Issue 25 and Issue 26**

4209 While a client is sending data to a printer, it SHOULD do its best to prevent a channel from being closed by
 4210 a lower layer when the channel is blocked (i.e. flow-controlled off) for whatever reason, e.g. 'out of paper'
 4211 or 'job ahead hasn't freed up enough memory'. However, the layer that launched the print submission (e.g.
 4212 an end user) MAY close the channel in order to cancel the job. When a client closes a channel, a Printer
 4213 MAY print all or part of the received portion of the document. See the "Encoding and Transport" document
 4214 [IPP-PRO] for more details. **Issue 4 and Issue 5**

4215 A client MUST support Client Authentication as defined in the IPP/1.1 Encoding and Transport document
 4216 [IPP-PRO]. A client SHOULD support Operation Privacy and Server Authentication as defined in the
 4217 IPP/1.1 Encoding and Transport document [IPP-PRO]. See also section 8 of this document. **Issue 32**

4218 5.2 IPP Object Conformance Requirements

4219 This section specifies the conformance requirements for conforming implementations of IPP objects (see
 4220 section 2). These requirements apply to an IPP object whether it is:

- 4221 (1) an (embedded) device component that accepts IPP requests and controls the device or
- 4222 (2) a component of a print server that accepts IPP requests (where the print server control one or
 4223 more networked devices using IPP or other protocols). **Issue 4**

4224 5.2.1 Objects

4225 Conforming implementations MUST implement all of the model objects as defined in this document in the
 4226 indicated sections:

- 4227 Section 2.1 - Printer Object
- 4228 Section 2.2 - Job Object

4229 5.2.2 Operations

4230 Conforming IPP object implementations MUST implement all of the REQUIRED model operations,
 4231 including REQUIRED responses, as defined in this document in the indicated sections:

4232 For a Printer object:

4233	Print-Job (section 3.2.1)	REQUIRED
4234	Print-URI (section 3.2.2)	OPTIONAL
4235	Validate-Job (section 3.2.3)	REQUIRED
4236	Create-Job (section 3.2.4)	OPTIONAL
4237	Get-Printer-Attributes (section 3.2.5)	REQUIRED
4238	Get-Jobs (section 3.2.6)	REQUIRED
4239	Pause-Printer (section 3.2.7)	OPTIONAL
4240	Resume-Printer (section 3.2.8)	OPTIONAL
4241	Purge-Jobs (section 3.2.9)	OPTIONAL

4242 For a Job object:

4243	Send-Document (section 3.3.1)	OPTIONAL
------	-------------------------------	----------

4245	Send-URI (section 3.3.2)	OPTIONAL
4246	Cancel-Job (section 3.3.3)	REQUIRED
4247	Get-Job-Attributes (section 3.3.4)	REQUIRED
4248	Hold-Job (section 3.3.5)	OPTIONAL
4249	Release-Job (section 3.3.6)	OPTIONAL
4250	Restart-Job (section 3.3.7)	OPTIONAL
4251		

4252 Conforming IPP objects **MUST** support all **REQUIRED** operation attributes and all values of such
4253 attributes if so indicated in the description. Conforming IPP objects **MUST** ignore all unsupported or
4254 unknown operation attributes or operation attribute groups received in a request, but **MUST** reject a request
4255 that contains a supported operation attribute that contains an unsupported value.

4256 Conforming IPP objects **MAY** return operation responses that contain attributes groups, attributes names,
4257 attribute syntaxes, attribute values, and status codes that are extensions to this standard. The additional
4258 attribute groups **MAY** occur in any order. **Issue 26**

4259 The following section on object attributes specifies the support required for object attributes.

4260 5.2.3 IPP Object Attributes

4261 Conforming IPP objects **MUST** support all of the **REQUIRED** object attributes, as defined in this document
4262 in the indicated sections.

4263 If an object supports an attribute, it **MUST** support only those values specified in this document or through
4264 the extension mechanism described in section 5.2.4. It **MAY** support any non-empty subset of these values.
4265 That is, it **MUST** support at least one of the specified values and at most all of them.

4266 5.2.4 Versions

4267 Clients **MUST** support version 1.1, i.e., **MUST** meet the conformance requirements for clients specified in
4268 this document and [IPP-PRO] and **SHOULD** also support version 1.0, i.e., **SHOULD** meet the conformance
4269 requirements for clients as specified in [RFC2566] and [RFC2565]. IPP objects **MUST** support version
4270 1.1, i.e., **MUST** meet the conformance requirements for IPP objects specified in this document and [IPP-
4271 PRO] and **SHOULD** also support version 1.0, i.e., **SHOULD** meet the conformance requirements for IPP
4272 objects as specified in [RFC2566] and [RFC2565].

4273 IPP clients **MUST** send a version '1.1' in requests and **SHOULD** try alternate versions if they receive a
4274 'server-error-version-not-supported' error return. IPP objects **MUST** accept a version '1.1' request (or reject
4275 the request if the operation is not supported). IPP objects **SHOULD** accept any request with the major
4276 version '1' (or reject the request if the operation is not supported). See section 3.1.8. **ISSUE 36**

4277 5.2.5 Extensions

4278 A conforming IPP object **MAY** support registered extensions and private extensions, as long as they meet
4279 the requirements specified in Section 6.

4280 For each attribute included in an operation response, a conforming IPP object MUST return a value whose
4281 type and value syntax conforms to the requirement of the Model document as specified in Sections 3 and 4.

4282 5.2.6 Attribute Syntaxes

4283 An IPP object MUST be able to accept any of the attribute syntaxes defined in Section 4.1, including their
4284 full range, in any operation in which a client may supply attributes or the system administrator may
4285 configure attributes (by means outside the scope of this IPP/1.1 document). In particular for each attribute
4286 that the IPP object supports whose attribute syntax is 'text', the IPP object MUST accept and process both
4287 the 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the IPP object
4288 supports whose attribute syntax is 'name', the IPP object MUST accept and process both the
4289 'nameWithoutLanguage' and 'nameWithLanguage' forms. Furthermore, an IPP object MUST return
4290 attributes to the client in operation responses that conform to the syntax specified in Section 4.1, including
4291 their full range if supplied previously by a client.

4292 5.2.7 Security **Issue 32**

4293 An IPP Printer implementation SHOULD contain support for Client Authentication as defined in the
4294 IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation MAY allow an
4295 administrator to configure the Printer so that all, some, or none of the users are authenticated. See also
4296 section 8 of this document.

4297 An IPP Printer implementation SHOULD contain support for Operation Privacy and Server Authentication
4298 as defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation MAY
4299 allow an administrator to configure the degree of support for Operation Privacy and Server Authentication.
4300 See also section 8 of this document.

4301 Security MUST NOT be compromised when a client supplies a lower "version-number" parameter in a
4302 request. For example, if an IPP/1.1 conforming Printer object accepts version '1.0' requests and is
4303 configured to enforce Digest Authentication, it MUST do the same for a version '1.0' request.

4304 5.3 Charset and Natural Language Requirements

4305 All clients and IPP objects MUST support the 'utf-8' charset as defined in section 4.1.7.

4306 IPP objects MUST be able to accept any client request which correctly uses the "attributes-natural-
4307 language" operation attribute or the Natural Language Override mechanism on any individual attribute
4308 whether or not the natural language is supported by the IPP object. If an IPP object supports a natural
4309 language, then it MUST be able to translate (perhaps by table lookup) all generated 'text' or 'name' attribute
4310 values into one of the supported languages (see section 3.1.4). That is, the IPP object that supports a
4311 natural language NEED NOT be a general purpose translator of any arbitrary 'text' or 'name' value supplied
4312 by the client into that natural language. However, the object MUST be able to translate (automatically
4313 generate) any of its own attribute values and messages into that natural language.

4314 6. IANA Considerations (registered and private extensions)

4315 This section describes how IPP can be extended to allow the following registered and private extensions to
4316 IPP:

- 4317 1. keyword attribute values
- 4318 2. enum attribute values
- 4319 3. attributes
- 4320 4. attribute syntaxes
- 4321 5. operations
- 4322 6. attribute groups
- 4323 7. status codes

4324

4325 Extensions registered for use with IPP/1.1 are OPTIONAL for client and IPP object conformance to the
4326 IPP/1.1 Model document.

4327 These extension procedures are aligned with the guidelines as set forth by the IESG [IANA-CON]. Section
4328 11 describes how to propose new registrations for consideration. IANA will reject registration proposals
4329 that leave out required information or do not follow the appropriate format described in Section 11. IPP/1.1
4330 may also be extended by an appropriate RFC that specifies any of the above extensions.

4331 6.1 Typed 'keyword' and 'enum' Extensions

4332 IPP allows for 'keyword' and 'enum' extensions (see sections 4.1.2.3 and 4.1.4). This document uses
4333 prefixes to the 'keyword' and 'enum' basic attribute syntax type in order to communicate extra information
4334 to the reader through its name. This extra information is not represented in the protocol because it is
4335 unimportant to a client or Printer object. The list below describes the prefixes and their meaning.

4336 "type1": This IPP specification document must be revised to add a new keyword or a new enum. No
4337 private keywords or enums are allowed.

4338

4339 "type2": Implementers can, at any time, add new keyword or enum values by proposing the complete
4340 specification to IANA:

4341

4342 iana@iana.org

4343

4344 IANA will forward the registration proposal to the IPP Designated Expert who will review the
4345 proposal with a mailing list that the Designated Expert keeps for this purpose. Initially, that list will
4346 be the mailing list used by the IPP WG:

4347

4348 ipp@pwg.org

4349

4350 even after the IPP WG is disbanded as permitted by [IANA-CON]. The IPP Designated Expert is
4351 appointed by the IESG Area Director responsible for IPP, according to [IANA-CON].

4352

4353 When a type2 keyword or enum is approved, the IPP Designated Expert becomes the point of
4354 contact for any future maintenance that might be required for that registration.

4355
4356 "type3": Implementers can, at any time, add new keyword and enum values by submitting the complete
4357 specification to IANA as for type2 who will forward the proposal to the IPP Designated Expert.
4358 While no additional technical review is required, the IPP Designated Expert may, at his/her
4359 discretion, forward the proposal to the same mailing list as for type2 registrations for advice and
4360 comment.

4361
4362 When a type3 keyword or enum is approved by the IPP Designated Expert, the original proposer
4363 becomes the point of contact for any future maintenance that might be required for that registration.

4364

4365 For type2 and type3 keywords, the proposer includes the name of the keyword in the registration proposal
4366 and the name is part of the technical review.

4367 After type2 and type3 enums specifications are approved, the IPP Designated Expert in consultation with
4368 IANA assigns the next available enum number for each enum value.

4369 IANA will publish approved type2 and type3 keyword and enum attributes value registration specifications
4370 in:

4371 ftp.isi.edu/iana/assignments/ipp/attribute-values/xxx/yyy.txt

4372 where xxx is the attribute name that specifies the initial values and yyy.txt is a descriptive file name that
4373 contains one or more enums or keywords approved at the same time. For example, if several additional
4374 enums for stapling are approved for use with the "finishings" attribute (and "finishings-default" and
4375 "finishings-supported" attributes), IANA will publish the additional values in the file:

4376 ftp.isi.edu/iana/assignments/ipp/attribute-values/finishings/stapling.txt

4377 Note: Some attributes are defined to be: 'type3 keywords' | 'name' which allows for attribute values to be
4378 extended by a site administrator with administrator defined names. Such names are not registered with
4379 IANA.

4380 By definition, each of the three types above assert some sort of registry or review process in order for
4381 extensions to be considered valid. Each higher numbered level (1, 2, 3) tends to be decreasingly less
4382 stringent than the previous level. Therefore, any typeN value MAY be registered using a process for some
4383 typeM where M is less than N, however such registration is NOT REQUIRED. For example, a type3 value
4384 MAY be registered in a type 1 manner (by being included in a future version of an IPP specification),
4385 however, it is NOT REQUIRED.

4386 This document defines keyword and enum values for all of the above types, including type3 keywords.

4387 For private (unregistered) keyword extensions, implementers SHOULD use keywords with a suitable
4388 distinguishing prefix, such as "xxx-" where xxx is the (lowercase) fully qualified company name registered

4389 with IANA for use in domain names [RFC1035]. For example, if the company XYZ Corp. had obtained
4390 the domain name "XYZ.com", then a private keyword 'abc' would be: 'xyz.com-abc'.

4391 Note: RFC 1035 [RFC1035] indicates that while upper and lower case letters are allowed in domain names,
4392 no significance is attached to the case. That is, two names with the same spelling but different case are to
4393 be treated as if identical. Also, the labels in a domain name must follow the rules for ARPANET host
4394 names: They must start with a letter, end with a letter or digit, and have as interior characters only letters,
4395 digits, and hyphen. Labels must be 63 characters or less. Labels are separated by the "." character.

4396 For private (unregistered) enum extension, implementers **MUST** use values in the reserved integer range
4397 which is 2**30 to 2**31-1.

4398 6.2 Attribute Extensibility

4399 Attribute names are type2 keywords. Therefore, new attributes may be registered and have the same status
4400 as attributes in this document by following the type2 extension rules. For private (unregistered) attribute
4401 extensions, implementers **SHOULD** use keywords with a suitable distinguishing prefix as described in
4402 Section 6.1.

4403 IANA will publish approved attribute registration specifications as separate files:

4404 ftp.isi.edu/iana/assignments/ipp/attributes/xxx-yyy.txt

4405 where "xxx-yyy" is the new attribute name.

4406 If a new Printer object attribute is defined and its values can be affected by a specific document format, its
4407 specification needs to contain the following sentence:

4408 "The value of this attribute returned in a Get-Printer-Attributes response **MAY** depend on the
4409 "document-format" attribute supplied (see Section 3.2.5.1)."

4410 If the specification does not, then its value in the Get-Printer-Attributes response **MUST NOT** depend on
4411 the "document-format" supplied in the request. When a new Job Template attribute is registered, the value
4412 of the Printer attributes **MAY** vary with "document-format" supplied in the request without the
4413 specification having to indicate so.

4414 6.3 Attribute Syntax Extensibility

4415 Attribute syntaxes are like type2 enums. Therefore, new attribute syntaxes may be registered and have the
4416 same status as attribute syntaxes in this document by following the type2 extension rules described in
4417 Section 6.1. The value codes that identify each of the attribute syntaxes are assigned in the "Encoding and
4418 Transport" document [IPP-PRO], including a designated range for private, experimental use.

4419 For attribute syntaxes, the IPP Designated Expert in consultation with IANA assigns the next attribute
4420 syntax code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute
4421 syntax registration specifications as separate files:

4422 ftp.isi.edu/iana/assignments/ipp/attribute-syntaxes/xxx-yyy.txt

4423 where `xxx-yyy` is the new attribute syntax name.

4424 6.4 Operation Extensibility

4425 Operations may also be registered following the type2 procedures described in Section 6.1, though major
4426 new operations will usually be done by a new standards track RFC that augments this document. For
4427 private (unregistered) operation extensions, implementers **MUST** use the range for the "operation-id" in
4428 requests specified in Section 4.4.15 "operations-supported" Printer attribute.

4429 For operations, the IPP Designated Expert in consultation with IANA assigns the next operation-id code as
4430 specified in Section 4.4.15. IANA will publish approved operation registration specifications as separate
4431 files:

4432 ftp.isi.edu/iana/assignments/ipp/operations/Xxx-Yyy.txt

4433 where "Xxx-Yyy" is the new operation name.

4434 6.5 Attribute Groups

4435 Attribute groups passed in requests and responses may be registered following the type2 procedures
4436 described in Section 6.1. The tags that identify each of the attribute groups are assigned in [IPP-PRO].

4437 For attribute groups, the IPP Designated Expert in consultation with IANA assigns the next attribute group
4438 tag code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute group
4439 registration specifications as separate files:

4440 ftp.isi.edu/iana/assignments/ipp/attribute-group-tags/xxx-yyy-tag.txt

4441 where `xxx-yyy-tag` is the new attribute group tag name.

4442 6.6 Status Code Extensibility

4443 Operation status codes may also be registered following the type2 procedures described in Section 6.1. The
4444 values for status codes are allocated in ranges as specified in Section 14 for each status code class:

4445 "informational" - Request received, continuing process
4446 "successful" - The action was successfully received, understood, and accepted
4447 "redirection" - Further action must be taken in order to complete the request
4448 "client-error" - The request contains bad syntax or cannot be fulfilled
4449 "server-error" - The IPP object failed to fulfill an apparently valid request
4450

4451 For private (unregistered) operation status code extensions, implementers **MUST** use the top of each range
4452 as specified in Section 13.

4453 For operation status codes, the IPP Designated Expert in consultation with IANA assigns the next status
4454 code in the appropriate class range as specified in Section 13. IANA will publish approved status code
4455 registration specifications as separate files:

4456 ftp.isi.edu/iana/assignments/ipp/status-codes/xxx-yyy.txt

4457 where "xxx-yyy" is the new operation status code keyword.

4458 6.7 Registration of MIME types/sub-types for document-formats

4459 The "document-format" attribute's syntax is 'mimeMediaType'. This means that valid values are Internet
4460 Media Types (see Section 4.1.9). RFC 2045 [RFC2045] defines the syntax for valid Internet media types.
4461 IANA is the registry for all Internet media types.

4462 6.8 Registration of charsets for use in 'charset' attribute values

4463 The "attributes-charset" attribute's syntax is 'charset'. This means that valid values are charsets names.
4464 When a charset in the IANA registry has more than one name (alias), the name labeled as "(preferred
4465 MIME name)", if present, MUST be used (see Section 4.1.7). IANA is the registry for charsets following
4466 the procedures of [RFC2278].

4467 7. Internationalization Considerations

4468 Some of the attributes have values that are text strings and names which are intended for human
4469 understanding rather than machine understanding (see the 'text' and 'name' attribute syntaxes in Sections
4470 4.1.1 and 4.1.2).

4471 In each operation request, the client

- 4472 - identifies the charset and natural language of the request which affects each supplied 'text' and 'name'
4473 attribute value, and
 - 4474 - requests the charset and natural language for attributes returned by the IPP object in operation
4475 responses (as described in Section 3.1.4.1).
- 4476

4477 In addition, the client MAY separately and individually identify the Natural Language Override of a
4478 supplied 'text' or 'name' attribute using the 'textWithLanguage' and 'nameWithLanguage' technique
4479 described section 4.1.1.2 and 4.1.2.2 respectively.

4480 All IPP objects MUST support the UTF-8 [RFC2279] charset in all 'text' and 'name' attributes supported. If
4481 an IPP object supports more than the UTF-8 charset, the object MUST convert between them in order to
4482 return the requested charset to the client according to Section 3.1.4.2. If an IPP object supports more than
4483 one natural language, the object SHOULD return 'text' and 'name' values in the natural language requested
4484 where those values are generated by the Printer (see Section 3.1.4.1).

4485 For Printers that support multiple charsets and/or multiple natural languages in 'text' and 'name' attributes,
4486 different jobs may have been submitted in differing charsets and/or natural languages. All responses MUST
4487 be returned in the charset requested by the client. However, the Get-Jobs operation uses the
4488 'textWithLanguage' and 'nameWithLanguage' mechanism to identify the differing natural languages with
4489 each job attribute returned.

4490 The Printer object also has configured charset and natural language attributes. The client can query the
4491 Printer object to determine the list of charsets and natural languages supported by the Printer object and
4492 what the Printer object's configured values are. See the "charset-configured", "charset-supported", "natural-
4493 language-configured", and "generated-natural-language-supported" Printer description attributes for more
4494 details.

4495 The "charset-supported" attributed identifies the supported charsets. If a charset is supported, the IPP
4496 object MUST be capable of converting to and from that charset into any other supported charset. In many
4497 cases, an IPP object will support only one charset and it MUST be the UTF-8 charset.

4498 The "charset-configured" attribute identifies the one supported charset which is the native charset given the
4499 current configuration of the IPP object (administrator defined).

4500 The "generated-natural-language-supported" attribute identifies the set of supported natural languages for
4501 generated messages; it is not related to the set of natural languages that must be accepted for client supplied
4502 'text' and 'name' attributes. For client supplied 'text' and 'name' attributes, an IPP object MUST accept ALL
4503 supplied natural languages. Just because a Printer object is currently configured to support 'en-us' natural
4504 language does not mean that the Printer object should reject a job if the client supplies a job name that is in
4505 'fr-ca'.

4506 The "natural-language-configured" attribute identifies the one supported natural language for generated
4507 messages which is the native natural language given the current configuration of the IPP object
4508 (administrator defined).

4509 Attributes of type 'text' and 'name' are populated from different sources. These attributes can be categorized
4510 into following groups (depending on the source of the attribute):

- 4511 1. Some attributes are supplied by the client (e.g., the client supplied "job-name", "document-name",
4512 and "requesting-user-name" operation attributes along with the corresponding Job object's "job-
4513 name" and "job-originating-user-name" attributes). The IPP object MUST accept these attributes in
4514 any natural language no matter what the set of supported languages for generated messages
- 4515 2. Some attributes are supplied by the system administrator (e.g., the Printer object's "printer-name" and
4516 "printer-location" attributes). These too can be in any natural language. If the natural language for
4517 these attributes is different than what a client requests, then they must be reported using the Natural
4518 Language Override mechanism.
- 4519 3. Some attributes are supplied by the device manufacturer (e.g., the Printer object's "printer-make-and-
4520 model" attribute). These too can be in any natural language. If the natural language for these
4521 attributes is different than what a client requests, then they must be reported using the Natural
4522 Language Override mechanism.
- 4523 4. Some attributes are supplied by the operator (e.g., the Job object's "job-message-from-operator"
4524 attribute). These too can be in any natural language. If the natural language for these attributes is

4525 different than what a client requests, then they must be reported using the Natural Language
4526 Override mechanism.

4527 5. Some attributes are generated by the IPP object (e.g., the Job object's "job-state-message" attribute,
4528 the Printer object's "printer-state-message" attribute, and the "status-message" operation attribute).
4529 These attributes can only be in one of the "generated-natural-language-supported" natural
4530 languages. If a client requests some natural language for these attributes other than one of the
4531 supported values, the IPP object SHOULD respond using the value of the "natural-language-
4532 configured" attribute (using the Natural Language Override mechanism if needed).
4533

4534 The 'text' and 'name' attributes specified in this version of this document (additional ones will be registered
4535 according to the procedures in Section 6) are:

Attributes	Source
Operation Attributes:	
job-name (name)	client
document-name (name)	client
requesting-user-name (name)	client
status-message	Job or Printer object
Job Template Attributes:	
job-hold-until (keyword name)	client matches administrator-configured
job-hold-until-default (keyword name)	client matches administrator-configured
job-hold-until-supported (keyword name)	client matches administrator-configured
job-sheets (keyword name)	client matches administrator-configured
job-sheets-default (keyword name)	client matches administrator-configured
job-sheets-supported (keyword name)	client matches administrator-configured
media (keyword name)	client matches administrator-configured
media-default (keyword name)	client matches administrator-configured
media-supported (keyword name)	client matches administrator-configured
media-ready (keyword name)	client matches administrator-configured
Job Description Attributes:	
job-name (name)	client or Printer object
job-originating-user-name (name)	Printer object
job-state-message (text)	Job or Printer object
output-device-assigned (name(127))	administrator
job-message-from-operator (text(127))	operator
Printer Description Attributes:	
printer-name (name(127))	administrator
printer-location (text(127))	administrator
printer-info (text(127))	administrator
printer-make-and-model (text(127))	administrator or manufacturer

	printer-state-message (text)	Printer object
	printer-message-from-operator (text(127))	operator

4536 8. Security Considerations

4537 It is difficult to anticipate the security risks that might exist in any given IPP environment. For example, if
 4538 IPP is used within a given corporation over a private network, the risks of exposing document data may be
 4539 low enough that the corporation will choose not to use encryption on that data. However, if the connection
 4540 between the client and the IPP object is over a public network, the client may wish to protect the content of
 4541 the information during transmission through the network with encryption.

4542 Furthermore, the value of the information being printed may vary from one IPP environment to the next.
 4543 Printing payroll checks, for example, would have a different value than printing public information from a
 4544 file. There is also the possibility of denial-of-service attacks, but denial-of-service attacks against printing
 4545 resources are not well understood and there is no published precedents regarding this scenario.

4546 Once the authenticated identity of the requester has been supplied to the IPP object, the object uses that
 4547 identity to enforce any authorization policy that might be in place. For example, one site's policy might be
 4548 that only the job owner is allowed to cancel a job. The details and mechanisms to set up a particular access
 4549 control policy are not part of IPP/1.1, and must be established via some other type of administrative or
 4550 access control framework. However, there are operation status codes that allow an IPP server to return
 4551 information back to a client about any potential access control violations for an IPP object.

4552 During a create operation, the client's identity is recorded in the Job object in an implementation-defined
 4553 attribute. This information can be used to verify a client's identity for subsequent operations on that Job
 4554 object in order to enforce any access control policy that might be in effect. See section 8.3 below for more
 4555 details.

4556 Since the security levels or the specific threats that any given IPP system administrator may be concerned
 4557 with cannot be anticipated, IPP **MUST** be capable of operating with different security mechanisms and
 4558 security policies as required by the individual installation. Security policies might vary from very strong, to
 4559 very weak, to none at all, and corresponding security mechanisms will be required.

4560 8.1 Security Scenarios

4561 The following sections describe specific security attacks for IPP environments. Where examples are
 4562 provided they should be considered illustrative of the environment and not an exhaustive set. Not all of
 4563 these environments will necessarily be addressed in initial implementations of IPP.

4564 8.1.1 Client and Server in the Same Security Domain

4565 This environment is typical of internal networks where traditional office workers print the output of
 4566 personal productivity applications on shared work-group printers, or where batch applications print their
 4567 output on large production printers. Although the identity of the user may be trusted in this environment, a

4568 user might want to protect the content of a document against such attacks as eavesdropping, replaying or
4569 tampering.

4570 8.1.2 Client and Server in Different Security Domains

4571 Examples of this environment include printing a document created by the client on a publicly available
4572 printer, such as at a commercial print shop; or printing a document remotely on a business associate's
4573 printer. This latter operation is functionally equivalent to sending the document to the business associate as
4574 a facsimile. Printing sensitive information on a Printer in a different security domain requires strong
4575 security measures. In this environment authentication of the printer is required as well as protection against
4576 unauthorized use of print resources. Since the document crosses security domains, protection against
4577 eavesdropping and document tampering are also required. It will also be important in this environment to
4578 protect Printers against "spamming" and malicious document content.

4579 8.1.3 Print by Reference

4580 When the document is not stored on the client, printing can be done by reference. That is, the print request
4581 can contain a reference, or pointer, to the document instead of the actual document itself (see sections 3.2.2
4582 and 3.3.2). Standard methods currently do not exist for remote entities to "assume" the credentials of a
4583 client for forwarding requests to a 3rd party. It is anticipated that Print-By-Reference will be used to access
4584 "public" documents and that sophisticated methods for authenticating "proxies" is not specified in this
4585 document.

4586 8.2 URIs in Operation, Job, and Printer attributes

4587 The "printer-uri-supported" attribute contains the Printer object's URI(s). Its companion attribute, "uri-
4588 security-supported", identifies the security mechanism used for each URI listed in the "printer-uri-
4589 supported" attribute. For each Printer operation request, a client MUST supply only one URI in the
4590 "printer-uri" operation attribute. In other words, even though the Printer supports more than one URI, the
4591 client only interacts with the Printer object using one of its URIs. This duality is not needed for Job objects,
4592 since the Printer objects is the factory for Job objects, and the Printer object will generate the correct URI
4593 for new Job objects depending on the Printer object's security configuration.

4594 8.3 URIs for each authentication mechanisms

4595 Each URI has an authentication mechanism associated with it. If the URI is the *i*'th element of "printer-uri-
4596 supported", then authentication mechanism is the "*i* th" element of "uri-authentication-supported". For a list
4597 of possible authentication mechanisms, see section 4.4.2.

4598 The Printer object uses an authentication mechanism to determine the name of the user performing an
4599 operation. This user is called the "authenticated user". The credibility of authentication depends on the
4600 mechanism that the Printer uses to obtain the user's name. When the authentication mechanism is 'none', all
4601 authenticated users are "anonymous".

4602 During job creation operations, the Printer initializes the value of the "job-originating-user-name" attribute
4603 (see section 4.3.6) to be the authenticated user. The authenticated user in this case is called the "job-owner".

4604 If an implementation can be configured to support more than one authentication mechanism, then it **MUST**
4605 implement rules for determining equality of authenticated user names which have been authenticated via
4606 different authentication mechanisms. One possible policy is that identical names that are authenticated via
4607 different mechanism are different. For example, a user can cancel his job only if he uses the same
4608 authentication mechanism for both Cancel-Job and Print-Job. Another policy is that identical names that
4609 are authenticated via different mechanism are the same if the authentication mechanism for the later
4610 operation is not less strong than the authentication mechanism for the earlier job creation operation. For
4611 example, a user can cancel his job only if he uses the same or stronger authentication mechanism for
4612 Cancel-Job and Print-Job. With this second policy a job submitted via 'requesting-user-name' authentication
4613 could be cancelled via 'digest' authentication. With the first policy, the job could not be cancelled in this
4614 way.

4615 A client is able to determine the authentication mechanism used to create a job. It is the *i*'th value of the
4616 Printer's "uri-authentication-supported" attribute (see section 4.4.2), where *i* is the index of the element of
4617 the Printer's "printer-uri-supported" attribute (see section 4.4.1) equal to the job's "job-printer-uri" attribute
4618 (see section 4.3.3).

4619

4620

4621

4622

4623 8.4 Restricted Queries

4624 In many IPP operations, a client supplies a list of attributes to be returned in the response. For security
4625 reasons, an IPP object may be configured not to return all attributes (or all values) that a client requests.
4626 The job attributes returned **MAY** depend on whether the requesting user is the same as the user that
4627 submitted the job. The IPP object **MAY** even return none of the requested attributes. In such cases, the
4628 status returned is the same as if the object had returned all requested attributes. The client cannot tell by
4629 such a response whether the requested attribute was present or absent on the object.

4630 8.5 Operations performed by operators and system administrators

4631 For the three printer operations Pause-Printer, Resume-Printer, and Purge-Jobs (see sections 3.2.7, 3.2.8 and
4632 3.2.9), the requesting user is intended to be an operator or administrator of the Printer object (see section 1).
4633 For operations on jobs, the requesting user is intended to be the job owner or may be an operator or
4634 administrator of the Printer object. The means for authorizing an operator or administrator of the Printer
4635 object are not specified in this document.

4636 8.6 Queries on jobs submitted using non-IPP protocols

4637 If the device that an IPP Printer is representing is able to accept jobs using other job submission protocols
4638 in addition to IPP, it is RECOMMENDED that such an implementation at least allow such "foreign" jobs to
4639 be queried using Get-Jobs returning "job-id" and "job-uri" as 'unknown'. Such an implementation NEED
4640 NOT support all of the same IPP job attributes as for IPP jobs. The IPP object returns the 'unknown' out-of-
4641 band value for any requested attribute of a foreign job that is supported for IPP jobs, but not for foreign
4642 jobs.

4643 It is further RECOMMENDED, that the IPP Printer generate "job-id" and "job-uri" values for such "foreign
4644 jobs", if possible, so that they may be targets of other IPP operations, such as Get-Job-Attributes and
4645 Cancel-Job. Such an implementation also needs to deal with the problem of authentication of such foreign
4646 jobs. One approach would be to treat all such foreign jobs as belonging to users other than the user of the
4647 IPP client. Another approach would be for the foreign job to belong to 'anonymous'. Only if the IPP client
4648 has been authenticated as an operator or administrator of the IPP Printer object, could the foreign jobs be
4649 queried by an IPP request. Alternatively, if the security policy is to allow users to query other users' jobs,
4650 then the foreign jobs would also be visible to an end-user IPP client using Get-Jobs and Get-Job-Attributes.

4867 11. Formats for IPP Registration Proposals

4868 In order to propose an IPP extension for registration, the proposer must submit an application to IANA by
4869 email to "iana@iana.org" or by filling out the appropriate form on the IANA web pages
4870 (<http://www.iana.org>). This section specifies the required information and the formats for proposing
4871 registrations of extensions to IPP as provided in Section 6 for:

4872

- 4873 1. type2 'keyword' attribute values
- 4874 2. type3 'keyword' attribute values
- 4875 3. type2 'enum' attribute values
- 4876 4. type3 'enum' attribute values
- 4877 5. attributes
- 4878 6. attribute syntaxes
- 4879 7. operations
- 4880 8. status codes

4881 11.1 Type2 keyword attribute values registration

4882 Type of registration: type2 keyword attribute value

4883 Name of attribute to which this keyword specification is to be added:

4884 Proposed keyword name of this keyword value:

4885 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):

4886 Name of proposer:

4887 Address of proposer:

4888 Email address of proposer:

4889

4890 Note: For type2 keywords, the Designated Expert will be the point of contact for the approved registration
4891 specification, if any maintenance of the registration specification is needed.

4892 11.2 Type3 keyword attribute values registration

4893 Type of registration: type3 keyword attribute value

4894 Name of attribute to which this keyword specification is to be added:

4895 Proposed keyword name of this keyword value:

4896 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):

4897 Name of proposer:

4898 Address of proposer:

4899 Email address of proposer:

4900

4901 Note: For type3 keywords, the proposer will be the point of contact for the approved registration
4902 specification, if any maintenance of the registration specification is needed.

4903 11.3 Type2 enum attribute values registration

4904 Type of registration: type2 enum attribute value

4905 Name of attribute to which this enum specification is to be added:
4906 Keyword symbolic name of this enum value:
4907 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):
4908 Specification of this enum value (follow the style of IPP Model Section 4.1.4):
4909 Name of proposer:
4910 Address of proposer:
4911 Email address of proposer:
4912
4913 Note: For type2 enums, the Designated Expert will be the point of contact for the approved registration
4914 specification, if any maintenance of the registration specification is needed.

4915 11.4 Type3 enum attribute values registration

4916 Type of registration: type3 enum attribute value
4917 Name of attribute to which this enum specification is to be added:
4918 Keyword symbolic name of this enum value:
4919 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):
4920 Specification of this enum value (follow the style of IPP Model Section 4.1.4):
4921 Name of proposer:
4922 Address of proposer:
4923 Email address of proposer:
4924
4925 Note: For type3 enums, the proposer will be the point of contact for the approved registration specification,
4926 if any maintenance of the registration specification is needed.

4927 11.5 Attribute registration

4928 Type of registration: attribute
4929 Proposed keyword name of this attribute:
4930 Types of attribute (Operation, Job Template, Job Description, Printer Description):
4931 Operations to be used with if the attribute is an operation attribute:
4932 Object (Job, Printer, etc. if bound to an object):
4933 Attribute syntax(es) (include 1setOf and range as in Section 4.2):
4934 If attribute syntax is 'keyword' or 'enum', is it type2 or type3:
4935 If this is a Printer attribute, MAY the value returned depend on "document-format" (See Section 6.2):
4936 If this is a Job Template attribute, how does its specification depend on the value of the "multiple-
4937 document-handling" attribute:
4938 Specification of this attribute (follow the style of IPP Model Section 4.2):
4939 Name of proposer:
4940 Address of proposer:
4941 Email address of proposer:
4942
4943 Note: For attributes, the IPP Designated Expert will be the point of contact for the approved registration
4944 specification, if any maintenance of the registration specification is needed.

4945 11.6 Attribute Syntax registration

4946 Type of registration: attribute syntax

4947 Proposed name of this attribute syntax:

4948 Type of attribute syntax (integer, octetString, character-string, see [IPP-PRO]):

4949 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

4950 Specification of this attribute (follow the style of IPP Model Section 4.1):

4951 Name of proposer:

4952 Address of proposer:

4953 Email address of proposer:

4954

4955 Note: For attribute syntaxes, the IPP Designated Expert will be the point of contact for the approved
4956 registration specification, if any maintenance of the registration specification is needed.

4957 11.7 Operation registration

4958 Type of registration: operation

4959 Proposed name of this operation:

4960 Numeric operation-id value (to be assigned by the IPP Designated Expert in consultation with IANA):

4961 Object Target (Job, Printer, etc. that operation is upon):

4962 Specification of this attribute (follow the style of IPP Model Section 3):

4963 Name of proposer:

4964 Address of proposer:

4965 Email address of proposer:

4966

4967 Note: For operations, the IPP Designated Expert will be the point of contact for the approved registration
4968 specification, if any maintenance of the registration specification is needed.

4969 11.8 Attribute Group registration

4970 Type of registration: attribute group

4971 Proposed name of this attribute group:

4972 Numeric tag according to [IPP-PRO] (to be assigned by the IPP Designated Expert in consultation with
4973 IANA):

4974 Operation requests and group number for each operation in which the attribute group occurs:

4975 Operation responses and group number for each operation in which the attribute group occurs:

4976 Specification of this attribute group (follow the style of IPP Model Section 3):

4977 Name of proposer:

4978 Address of proposer:

4979 Email address of proposer:

4980

4981 Note: For attribute groups, the IPP Designated Expert will be the point of contact for the approved
4982 registration specification, if any maintenance of the registration specification is needed.

4983 11.9 Status code registration

4984 Type of registration: status code

4985 Keyword symbolic name of this status code value:

4986 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

4987 Operations that this status code may be used with:

4988 Specification of this status code (follow the style of IPP Model Section 13 APPENDIX B: Status Codes
4989 and Suggested Status Code Messages):

4990 Name of proposer:

4991 Address of proposer:

4992 Email address of proposer:

4993

4994 Note: For status codes, the Designated Expert will be the point of contact for the approved registration
4995 specification, if any maintenance of the registration specification is needed.

4996 12. APPENDIX A: Terminology

4997 This specification document uses the terminology defined in this section.

4998 12.1 Conformance Terminology

4999 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT",
5000 "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in
5001 RFC 2119 [RFC2119].

5002 12.1.1 NEED NOT

5003 This term is not included in RFC 2119. The verb "NEED NOT" indicates an action that the subject of the
5004 sentence does not have to implement in order to claim conformance to the standard. The verb "NEED
5005 NOT" is used instead of "MAY NOT" since "MAY NOT" sounds like a prohibition.

5006 12.2 Model Terminology

5007 12.2.1 Keyword

5008 Keywords are used within this document as identifiers of semantic entities within the abstract model (see
5009 section 4.1.2.3). Attribute names, some attribute values, attribute syntaxes, and attribute group names are
5010 represented as keywords.

5011 12.2.2 Attributes

5012 An attribute is an item of information that is associated with an instance of an IPP object. An attribute
5013 consists of an attribute name and one or more attribute values. Each attribute has a specific attribute syntax.
5014 All object attributes are defined in section 4 and all operation attributes are defined in section 3.

5015 Job Template Attributes are described in section 4.2. The client optionally supplies Job Template attributes
5016 in a create request (operation requests that create Job objects). The Printer object has associated attributes
5017 which define supported and default values for the Printer.

5018 12.2.2.1 Attribute Name

5019 Each attribute is uniquely identified in this document by its attribute name. An attribute name is a keyword.
5020 The keyword attribute name is given in the section header describing that attribute. In running text in this
5021 document, attribute names are indicated inside double quotation marks (") where the quotation marks are
5022 not part of the keyword itself.

5023 12.2.2.2 Attribute Group Name

5024 Related attributes are grouped into named groups. The name of the group is a keyword. The group name
5025 may be used in place of naming all the attributes in the group explicitly. Attribute groups are defined in
5026 section 3.

5027 12.2.2.3 Attribute Value

5028 Each attribute has one or more values. Attribute values are represented in the syntax type specified for that
5029 attribute. In running text in this document, attribute values are indicated inside single quotation marks ('),
5030 whether their attribute syntax is keyword, integer, text, etc. where the quotation marks are not part of the
5031 value itself.

5032 12.2.2.4 Attribute Syntax

5033 Each attribute is defined using an explicit syntax type. In this document, each syntax type is defined as a
5034 keyword with specific meaning. The "Encoding and Transport" document [IPP-PRO] indicates the actual
5035 "on-the-wire" encoding rules for each syntax type. Attribute syntax types are defined in section 4.1.

5036 12.2.3 Supports

5037 By definition, a Printer object supports an attribute only if that Printer object responds with the
5038 corresponding attribute populated with some value(s) in a response to a query for that attribute. A Printer
5039 object supports an attribute value if the value is one of the Printer object's "supported values" attributes.
5040 The device behind a Printer object may exhibit a behavior that corresponds to some IPP attribute, but if the
5041 Printer object, when queried for that attribute, doesn't respond with the attribute, then as far as IPP is
5042 concerned, that implementation does not support that feature. If the Printer object's "xxx-supported"

5043 attribute is not populated with a particular value (even if that value is a legal value for that attribute), then
5044 that Printer object does not support that particular value.

5045 A conforming implementation **MUST** support all **REQUIRED** attributes. However, even for **REQUIRED**
5046 attributes, conformance to IPP does not mandate that all implementations support all possible values
5047 representing all possible job processing behaviors and features. For example, if a given instance of a
5048 Printer supports only certain document formats, then that Printer responds with the "document-format-
5049 supported" attribute populated with a set of values, possibly only one, taken from the entire set of possible
5050 values defined for that attribute. This limited set of values represents the Printer's set of supported
5051 document formats. Supporting an attribute and some set of values for that attribute enables IPP end users to
5052 be aware of and make use of those features associated with that attribute and those values. If an
5053 implementation chooses to not support an attribute or some specific value, then IPP end users would have
5054 no ability to make use of that feature within the context of IPP itself. However, due to existing practice and
5055 legacy systems which are not IPP aware, there might be some other mechanism outside the scope of IPP to
5056 control or request the "unsupported" feature (such as embedded instructions within the document data
5057 itself).

5058 For example, consider the "finishings-supported" attribute.

- 5059 1) If a Printer object is not physically capable of stapling, the "finishings-supported" attribute **MUST**
5060 NOT be populated with the value of 'staple'.
- 5061 2) A Printer object is physically capable of stapling, however an implementation chooses not to support
5062 stapling in the IPP "finishings" attribute. In this case, 'staple' **MUST NOT** be a value in the
5063 "finishings-supported" Printer object attribute. Without support for the value 'staple', an IPP end
5064 user would have no means within the protocol itself to request that a Job be stapled. However, an
5065 existing document data formatter might be able to request that the document be stapled directly with
5066 an embedded instruction within the document data. In this case, the IPP implementation does not
5067 "support" stapling, however the end user is still able to have some control over the stapling of the
5068 completed job.
- 5069 3) A Printer object is physically capable of stapling, and an implementation chooses to support stapling
5070 in the IPP "finishings" attribute. In this case, 'staple' **MUST** be a value in the "finishings-supported"
5071 Printer object attribute. Doing so, would enable end users to be aware of and make use of the
5072 stapling feature using IPP attributes.

5073
5074 Even though support for Job Template attributes by a Printer object is **OPTIONAL**, it is **RECOMMENDED**
5075 that if the device behind a Printer object is capable of realizing any feature or function that corresponds to
5076 an IPP attribute and some associated value, then that implementation **SHOULD** support that IPP attribute
5077 and value.

5078 The set of values in any of the supported value attributes is set (populated) by some administrative process
5079 or automatic sensing mechanism that is outside the scope of this IPP/1.1 document. For administrative
5080 policy and control reasons, an administrator may choose to make only a subset of possible values visible to
5081 the end user. In this case, the real output device behind the IPP Printer abstraction may be capable of a
5082 certain feature, however an administrator is specifying that access to that feature not be exposed to the end
5083 user through the IPP protocol. Also, since a Printer object may represent a logical print device (not just a
5084 physical device) the actual process for supporting a value is undefined and left up to the implementation.

5085 However, if a Printer object supports a value, some manual human action may be needed to realize the
5086 semantic action associated with the value, but no end user action is required.

5087 For example, if one of the values in the "finishings-supported" attribute is 'staple', the actual process might
5088 be an automatic staple action by a physical device controlled by some command sent to the device. Or, the
5089 actual process of stapling might be a manual action by an operator at an operator attended Printer object.

5090 For another example of how supported attributes function, consider a system administrator who desires to
5091 control all print jobs so that no job sheets are printed in order to conserve paper. To force no job sheets, the
5092 system administrator sets the only supported value for the "job-sheets-supported" attribute to 'none'. In this
5093 case, if a client requests anything except 'none', the create request is rejected or the "job-sheets" value is
5094 ignored (depending on the value of "ipp-attribute-fidelity"). To force the use of job start/end sheets on all
5095 jobs, the administrator does not include the value 'none' in the "job-sheets-supported" attribute. In this case,
5096 if a client requests 'none', the create request is rejected or the "job-sheets" value is ignored (again depending
5097 on the value of "ipp-attribute-fidelity").

5098 12.2.4 print-stream page

5099 A "print-stream page" is a page according to the definition of pages in the language used to express the
5100 document data.

5101 12.2.5 impression

5102 An "impression" is the image (possibly many print-stream pages in different configurations) imposed onto a
5103 single media page.

5104 13. APPENDIX B: Status Codes and Suggested Status Code Messages

5105 This section defines status code enum keywords and values that are used to provide semantic information
5106 on the results of an operation request. Each operation response **MUST** include a status code. The response
5107 **MAY** also contain a status message that provides a short textual description of the status. The status code
5108 is intended for use by automata, and the status message is intended for the human end user. Since the status
5109 message is an **OPTIONAL** component of the operation response, an IPP application (i.e., a browser, GUI,
5110 print driver or gateway) is **NOT REQUIRED** to examine or display the status message, since it **MAY** not be
5111 returned to the application.

5112 The prefix of the status keyword defines the class of response as follows:

- 5113 "informational" - Request received, continuing process
- 5114 "successful" - The action was successfully received, understood, and accepted
- 5115 "redirection" - Further action must be taken in order to complete the request
- 5116 "client-error" - The request contains bad syntax or cannot be fulfilled
- 5117 "server-error" - The IPP object failed to fulfill an apparently valid request

5118

5119 As with type2 enums, IPP status codes are extensible. IPP clients are NOT REQUIRED to understand the
5120 meaning of all registered status codes, though such understanding is obviously desirable. However, IPP
5121 clients MUST understand the class of any status code, as indicated by the prefix, and treat any unrecognized
5122 response as being equivalent to the first status code of that class, with the exception that an unrecognized
5123 response MUST NOT be cached. For example, if an unrecognized status code of "client-error-xxx-yyy" is
5124 received by the client, it can safely assume that there was something wrong with its request and treat the
5125 response as if it had received a "client-error-bad-request" status code. In such cases, IPP applications
5126 SHOULD present the OPTIONAL message (if present) to the end user since the message is likely to
5127 contain human readable information which will help to explain the unusual status. The name of the enum
5128 is the suggested status message for US English.

5129 The status code values range from 0x0000 to 0x7FFF. The value ranges for each status code class are as
5130 follows:

5131 "successful" - 0x0000 to 0x00FF
5132 "informational" - 0x0100 to 0x01FF
5133 "redirection" - 0x0200 to 0x02FF
5134 "client-error" - 0x0400 to 0x04FF
5135 "server-error" - 0x0500 to 0x05FF
5136

5137 The top half (128 values) of each range (0x0n40 to 0x0nFF, for n = 0 to 5) is reserved for private use within
5138 each status code class. Values 0x0600 to 0x7FFF are reserved for future assignment and MUST NOT be
5139 used.

5140 13.1 Status Codes

5141 Each status code is described below. Section 13.1.5.9 contains a table that indicates which status codes
5142 apply to which operations. The Implementer's Guide [IPP-IIG] describe the suggested steps for processing
5143 IPP attributes for all operations, including returning status codes.

5144 13.1.1 Informational

5145 This class of status code indicates a provisional response and is to be used for informational purposes only.

5146 There are no status codes defined in IPP/1.1 for this class of status code.

5147 13.1.2 Successful Status Codes

5148 This class of status code indicates that the client's request was successfully received, understood, and
5149 accepted.

5150 13.1.2.1 successful-ok (0x0000)

5151 The request has succeeded and no request attributes were substituted or ignored. In the case of a response
5152 to a create request, the 'successful-ok' status code indicates that the request was successfully received and

5153 validated, and that the Job object has been created; it does not indicate that the job has been processed. The
5154 transition of the Job object into the 'completed' state is the only indicator that the job has been printed.

5155 13.1.2.2 successful-ok-ignored-or-substituted-attributes (0x0001)

5156 The request has succeeded, but some supplied (1) attributes were ignored or (2) unsupported values were
5157 substituted with supported values or were ignored in order to perform the operation without rejecting it.
5158 Unsupported attributes, attribute syntaxes, or values **MUST** be returned in the Unsupported Attributes
5159 group of the response for all operations. There is an exception to this rule for the query operations: Get-
5160 Printer-Attributes, Get-Jobs, and Get-Job-Attributes for the "requested-attributes" operation attribute only.
5161 When the supplied values of the "requested-attributes" operation attribute are requesting attributes that are
5162 not supported, the IPP object **MAY**, but is **NOT REQUIRED** to, return the "requested-attributes" attribute
5163 in the Unsupported Attribute response group (with the unsupported values only). See sections 3.1.7 and
5164 3.2.1.2.

5165 13.1.2.3 successful-ok-conflicting-attributes (0x0002)

5166 The request has succeeded, but some supplied attribute values conflicted with the values of other supplied
5167 attributes. These conflicting values were either (1) substituted with (supported) values or (2) the attributes
5168 were removed in order to process the job without rejecting it. Attributes or values which conflict with other
5169 attributes and have been substituted or ignored **MUST** be returned in the Unsupported Attributes group of
5170 the response for all operations as supplied by the client. See sections 3.1.7 and 3.2.1.2.

5171 13.1.3 Redirection Status Codes

5172 This class of status code indicates that further action needs to be taken to fulfill the request.

5173 There are no status codes defined in IPP/1.1 for this class of status code.

5174 13.1.4 Client Error Status Codes

5175 This class of status code is intended for cases in which the client seems to have erred. The IPP object
5176 **SHOULD** return a message containing an explanation of the error situation and whether it is a temporary or
5177 permanent condition.

5178 13.1.4.1 client-error-bad-request (0x0400)

5179 The request could not be understood by the IPP object due to malformed syntax (such as the value of a
5180 fixed length attribute whose length does not match the prescribed length for that attribute - see the
5181 Implementer's Guide [IPP-IIG]). The IPP application **SHOULD NOT** repeat the request without
5182 modifications.

5183 13.1.4.2 client-error-forbidden (0x0401)

5184 The IPP object understood the request, but is refusing to fulfill it. Additional authentication information or
5185 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is
5186 commonly used when the IPP object does not wish to reveal exactly why the request has been refused or
5187 when no other response is applicable.

5188 13.1.4.3 client-error-not-authenticated (0x0402)

5189 The request requires user authentication. The IPP client may repeat the request with suitable authentication
5190 information. If the request already included authentication information, then this status code indicates that
5191 authorization has been refused for those credentials. If this response contains the same challenge as the
5192 prior response, and the user agent has already attempted authentication at least once, then the response
5193 message may contain relevant diagnostic information. This status codes reveals more information than
5194 "client-error-forbidden".

5195 13.1.4.4 client-error-not-authorized (0x0403)

5196 The requester is not authorized to perform the request. Additional authentication information or
5197 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is used
5198 when the IPP object wishes to reveal that the authentication information is understandable, however, the
5199 requester is explicitly not authorized to perform the request. This status codes reveals more information
5200 than "client-error-forbidden" and "client-error-not-authenticated".

5201 13.1.4.5 client-error-not-possible (0x0404)

5202 This status code is used when the request is for something that can not happen. For example, there might
5203 be a request to cancel a job that has already been canceled or aborted by the system. The IPP client
5204 SHOULD NOT repeat the request.

5205 13.1.4.6 client-error-timeout (0x0405)

5206 The client did not produce a request within the time that the IPP object was prepared to wait. For example,
5207 a client issued a Create-Job operation and then, after a long period of time, issued a Send-Document
5208 operation and this error status code was returned in response to the Send-Document request (see section
5209 3.3.1). The IPP object might have been forced to clean up resources that had been held for the waiting
5210 additional Documents. The IPP object was forced to close the Job since the client took too long. The client
5211 SHOULD NOT repeat the request without modifications.

5212 13.1.4.7 client-error-not-found (0x0406)

5213 The IPP object has not found anything matching the request URI. No indication is given of whether the
5214 condition is temporary or permanent. For example, a client with an old reference to a Job (a URI) tries to
5215 cancel the Job, however in the mean time the Job might have been completed and all record of it at the
5216 Printer has been deleted. This status code, 'client-error-not-found' is returned indicating that the referenced

5217 Job can not be found. This error status code is also used when a client supplies a URI as a reference to the
5218 document data in either a Print-URI or Send-URI operation, but the document can not be found.

5219 In practice, an IPP application should avoid a not found situation by first querying and presenting a list of
5220 valid Printer URIs and Job URIs to the end-user.

5221 13.1.4.8 client-error-gone (0x0407)

5222 The requested object is no longer available and no forwarding address is known. This condition should be
5223 considered permanent. Clients with link editing capabilities should delete references to the request URI
5224 after user approval. If the IPP object does not know or has no facility to determine, whether or not the
5225 condition is permanent, the status code "client-error-not-found" should be used instead.

5226 This response is primarily intended to assist the task of maintenance by notifying the recipient that the
5227 resource is intentionally unavailable and that the IPP object administrator desires that remote links to that
5228 resource be removed. It is not necessary to mark all permanently unavailable resources as "gone" or to keep
5229 the mark for any length of time -- that is left to the discretion of the IPP object administrator.

5230 13.1.4.9 client-error-request-entity-too-large (0x0408)

5231 The IPP object is refusing to process a request because the request entity is larger than the IPP object is
5232 willing or able to process. An IPP Printer returns this status code when it limits the size of print jobs and it
5233 receives a print job that exceeds that limit or when the attributes are so many that their encoding causes the
5234 request entity to exceed IPP object capacity.

5235 13.1.4.10 client-error-request-value-too-long (0x0409)

5236 The IPP object is refusing to service the request because one or more of the client-supplied attributes has a
5237 variable length value that is longer than the maximum length specified for that attribute. The IPP object
5238 might not have sufficient resources (memory, buffers, etc.) to process (even temporarily), interpret, and/or
5239 ignore a value larger than the maximum length. Another use of this error code is when the IPP object
5240 supports the processing of a large value that is less than the maximum length, but during the processing of
5241 the request as a whole, the object may pass the value onto some other system component which is not able
5242 to accept the large value. For more details, see the Implementer's Guide [IPP-IIG] .

5243 Note: For attribute values that are URIs, this rare condition is only likely to occur when a client has
5244 improperly submitted a request with long query information (e.g. an IPP application allows an end-user to
5245 enter an invalid URI), when the client has descended into a URI "black hole" of redirection (e.g., a
5246 redirected URI prefix that points to a suffix of itself), or when the IPP object is under attack by a client
5247 attempting to exploit security holes present in some IPP objects using fixed-length buffers for reading or
5248 manipulating the Request-URI.

5249 13.1.4.11 client-error-document-format-not-supported (0x040A)

5250 The IPP object is refusing to service the request because the document data is in a format, as specified in
5251 the "document-format" operation attribute, that is not supported by the Printer object. This error is returned
5252 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code,
5253 even if there are other Job Template attributes that are not supported as well, since this error is a bigger
5254 problem than with Job Template attributes. See sections 3.1.7 and 3.2.1.1. **Issue 11**

5255 13.1.4.12 client-error-attributes-or-values-not-supported (0x040B)

5256 In a create request, if the Printer object does not support one or more attributes, attribute syntaxes, or
5257 attribute values supplied in the request and the client supplied the "ipp-attributes-fidelity" operation
5258 attribute with the 'true' value, the Printer object MUST return this status code. The Printer object MUST
5259 also return in the Unsupported Attributes Group all the attributes and/or values supplied by the client that
5260 are not supported. See section 3.1.7. **Issue 11** For example, if the request indicates 'iso-a4' media, but that
5261 media type is not supported by the Printer object. Or, if the client supplies a Job Template attribute and the
5262 attribute itself is not even supported by the Printer. If the "ipp-attribute-fidelity" attribute is 'false', the
5263 Printer MUST ignore or substitute values for unsupported Job Template attributes and values rather than
5264 reject the request and return this status code.

5265 For any operation where a client requests attributes (such as a Get-Jobs, Get-Printer-Attributes, or Get-Job-
5266 Attributes operation), if the IPP object does not support one or more of the requested attributes, the IPP
5267 object simply ignores the unsupported requested attributes and processes the request as if they had not been
5268 supplied, rather than returning this status code. In this case, the IPP object MUST return the 'successful-ok-
5269 ignored-or-substituted-attributes' status code and MAY return the unsupported attributes as values of the
5270 "requested-attributes" in the Unsupported Attributes Group (see section 13.1.2.2).

5271 13.1.4.13 client-error-uri-scheme-not-supported (0x040C)

5272 The scheme of the client-supplied URI in a Print-URI or a Send-URI operation is not supported. See
5273 section 3.1.7. **Issue 11**

5274 13.1.4.14 client-error-charset-not-supported (0x040D)

5275 For any operation, if the IPP Printer does not support the charset supplied by the client in the "attributes-
5276 charset" operation attribute, the Printer MUST reject the operation and return this status and any 'text' or
5277 'name' attributes using the 'utf-8' charset (see Section 3.1.4.1). See section 3.1.7. **Issue 11**

5278 13.1.4.15 client-error-conflicting-attributes (0x040E)

5279 The request is rejected because some attribute values conflicted with the values of other attributes which
5280 this document does not permit to be substituted or ignored. The Printer object MUST also return in the
5281 Unsupported Attributes Group the conflicting attributes supplied by the client. See sections 3.1.7 and
5282 3.2.1.2. **Issue 27**

5283 13.1.4.16 client-error-compression-not-supported (0x040F) **Issue 6**

5284 The IPP object is refusing to service the request because the document data, as specified in the
5285 "compression" operation attribute, is compressed in a way that is not supported by the Printer object. This
5286 error is returned independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return
5287 this status code, even if there are other Job Template attributes that are not supported as well, since this
5288 error is a bigger problem than with Job Template attributes. **Issue 6** See sections 3.1.7 and 3.2.1.1. **Issue 11**

5289 13.1.4.17 client-error-compression-error (0x0410) **Issue 6**

5290 The IPP object is refusing to service the request because the document data cannot be decompressed when
5291 using the algorithm specified by the "compression" operation attribute. This error is returned independent
5292 of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code, even if there
5293 are Job Template attributes that are not supported as well, since this error is a bigger problem than with Job
5294 Template attributes. See sections 3.1.7 and 3.2.1.1.

5295 13.1.4.18 client-error-document-format-error (0x0411) **Issue 28**

5296 The IPP object is refusing to service the request because Printer encountered an error in the document data
5297 while interpreting it. This error is returned independent of the client-supplied "ipp-attribute-fidelity". The
5298 Printer object MUST return this status code, even if there are Job Template attributes that are not supported
5299 as well, since this error is a bigger problem than with Job Template attributes. See sections 3.1.7 and
5300 3.2.1.1.

5301 13.1.4.19 client-error-document-access-error (0x0412) **Issue 35**

5302 The IPP object is refusing to service the Print-URI or Send-URI request because Printer encountered an
5303 access error while attempting to validate the accessibility or access the document data specified in the
5304 "document-uri" operation attribute. The Printer MAY also return a specific document access error code
5305 using the "document-access-error" operation attribute (see section 3.1.6.4). This error is returned
5306 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code,
5307 even if there are Job Template attributes that are not supported as well, since this error is a bigger problem
5308 than with Job Template attributes. See section 3.1.7.

5309 13.1.5 Server Error Status Codes

5310 This class of status codes indicates cases in which the IPP object is aware that it has erred or is incapable of
5311 performing the request. The IPP object SHOULD include a message containing an explanation of the error
5312 situation, and whether it is a temporary or permanent condition.

5313 13.1.5.1 server-error-internal-error (0x0500)

5314 The IPP object encountered an unexpected condition that prevented it from fulfilling the request. This error
5315 status code differs from "server-error-temporary-error" in that it implies a more permanent type of internal
5316 error. It also differs from "server-error-device-error" in that it implies an unexpected condition (unlike a

5317 paper-jam or out-of-toner problem which is undesirable but expected). This error status code indicates that
5318 probably some knowledgeable human intervention is required.

5319 13.1.5.2 server-error-operation-not-supported (0x0501)

5320 The IPP object does not support the functionality required to fulfill the request. This is the appropriate
5321 response when the IPP object does not recognize an operation or is not capable of supporting it. See section
5322 3.1.7. **Issue 18**

5323 13.1.5.3 server-error-service-unavailable (0x0502)

5324 The IPP object is currently unable to handle the request due to a temporary overloading or maintenance of
5325 the IPP object. The implication is that this is a temporary condition which will be alleviated after some
5326 delay. If known, the length of the delay may be indicated in the message. If no delay is given, the IPP
5327 application should handle the response as it would for a "server-error-temporary-error" response. If the
5328 condition is more permanent, the error status codes "client-error-gone" or "client-error-not-found" could be
5329 used.

5330 13.1.5.4 server-error-version-not-supported (0x0503)

5331 The IPP object does not support, or refuses to support, the IPP protocol version that was supplied as the
5332 value of the "version-number" operation parameter in the request. The IPP object is indicating that it is
5333 unable or unwilling to complete the request using the same major and minor version number as supplied in
5334 the request other than with this error message. The error response SHOULD contain a "status-message"
5335 attribute (see section 3.1.6.2) describing why that version is not supported and what other versions are
5336 supported by that IPP object. See section 3.1.8. **Issue 11**

5337 The error response MUST identify in the "version-number" operation parameter the closest version number
5338 that the IPP object does support. For example, if a client supplies version '1.0' and an IPP/1.1 object
5339 supports version '1.0', then it MUST respond with version '1.0' in all responses to such a request. If the
5340 IPP/1.1 object does not support version '1.0', then it SHOULD accept the request and respond with version
5341 '1.1' or MAY reject the request and respond with this error code and version '1.1'. If a client supplies a
5342 version '1.2' the IPP/1.1 object SHOULD accept the request and return version '1.1' or MAY reject the
5343 request and respond with this error code and version '1.1'. See sections 3.1.8 and 4.4.14. **Issue 36**

5344 13.1.5.5 server-error-device-error (0x0504)

5345 A printer error, such as a paper jam, occurs while the IPP object processes a Print or Send operation. The
5346 response contains the true Job Status (the values of the "job-state" and "job-state-reasons" attributes).
5347 Additional information can be returned in the OPTIONAL "job-state-message" attribute value or in the
5348 OPTIONAL status message that describes the error in more detail. This error status code is only returned in
5349 situations where the Printer is unable to accept the create request because of such a device error. For
5350 example, if the Printer is unable to spool, and can only accept one job at a time, the reason it might reject a
5351 create request is that the printer currently has a paper jam. In many cases however, where the Printer object
5352 can accept the request even though the Printer has some error condition, the 'successful-ok' status code will

5353 be returned. In such a case, the client would look at the returned Job Object Attributes or later query the
5354 Printer to determine its state and state reasons.

5355 13.1.5.6 server-error-temporary-error (0x0505)

5356 A temporary error such as a buffer full write error, a memory overflow (i.e. the document data exceeds the
5357 memory of the Printer), or a disk full condition, occurs while the IPP Printer processes an operation. The
5358 client MAY try the unmodified request again at some later point in time with an expectation that the
5359 temporary internal error condition may have been cleared. Alternatively, as an implementation option, a
5360 Printer object MAY delay the response until the temporary condition is cleared so that no error is returned.

5361 13.1.5.7 server-error-not-accepting-jobs (0x0506)

5362 A temporary error indicating that the Printer is not currently accepting jobs, because the administrator has
5363 set the value of the Printer's "printer-is-not-accepting-jobs" attribute to 'false' (by means outside the scope of
5364 this IPP/1.1 document).

5365 13.1.5.8 server-error-busy (0x0507)

5366 A temporary error indicating that the Printer is too busy processing jobs and/or other requests. The client
5367 SHOULD try the unmodified request again at some later point in time with an expectation that the
5368 temporary busy condition will have been cleared.

5369 13.1.5.9 server-error-job-canceled (0x0508)

5370 An error indicating that the job has been canceled by an operator or the system while the client was
5371 transmitting the data to the IPP Printer. If a job-id and job-uri had been created, then they are returned in
5372 the Print-Job, Send-Document, or Send-URI response as usual; otherwise, no job-id and job-uri are returned
5373 in the response.

5374 13.1.5.10 server-error-multiple-document-jobs-not-supported (0x0509) **Issue 34**

5375 The IPP object does not support multiple documents per job and a client attempted to supply document data
5376 with a second Send-Document or Send-URI operation.

5465 14. APPENDIX C: "media" keyword values

5466 Standard keyword values are taken from several sources.

5467 Standard values are defined (taken from DPA[ISO10175] and the Printer MIB[RFC1759]):

- 5468 'default': The default medium for the output device
- 5469 'iso-a4-white': Specifies the ISO A4 white medium
- 5470 'iso-a4-colored': Specifies the ISO A4 colored medium
- 5471 'iso-a4-transparent': Specifies the ISO A4 transparent medium
- 5472 'iso-a3-white': Specifies the ISO A3 white medium
- 5473 'iso-a3-colored': Specifies the ISO A3 colored medium
- 5474 'iso-a5-white': Specifies the ISO A5 white medium
- 5475 'iso-a5-colored': Specifies the ISO A5 colored medium
- 5476 'iso-b4-white': Specifies the ISO B4 white medium
- 5477 'iso-b4-colored': Specifies the ISO B4 colored medium
- 5478 'iso-b5-white': Specifies the ISO B5 white medium
- 5479 'iso-b5-colored': Specifies the ISO B5 colored medium
- 5480 'jis-b4-white': Specifies the JIS B4 white medium
- 5481 'jis-b4-colored': Specifies the JIS B4 colored medium
- 5482 'jis-b5-white': Specifies the JIS B5 white medium
- 5483 'jis-b5-colored': Specifies the JIS B5 colored medium

5484

5485 The following standard values are defined for North American media:

- 5486 'na-letter-white': Specifies the North American letter white medium
- 5487 'na-letter-colored': Specifies the North American letter colored medium
- 5488 'na-letter-transparent': Specifies the North American letter transparent medium
- 5489 'na-legal-white': Specifies the North American legal white medium
- 5490 'na-legal-colored': Specifies the North American legal colored medium

5491

5492 The following standard values are defined for envelopes:

- 5493 'iso-b4-envelope': Specifies the ISO B4 envelope medium
- 5494 'iso-b5-envelope': Specifies the ISO B5 envelope medium
- 5495 'iso-c3-envelope': Specifies the ISO C3 envelope medium
- 5496 'iso-c4-envelope': Specifies the ISO C4 envelope medium
- 5497 'iso-c5-envelope': Specifies the ISO C5 envelope medium
- 5498 'iso-c6-envelope': Specifies the ISO C6 envelope medium
- 5499 'iso-designated-long-envelope': Specifies the ISO Designated Long envelope medium
- 5500 'na-10x13-envelope': Specifies the North American 10x13 envelope medium
- 5501 'na-9x12-envelope': Specifies the North American 9x12 envelope medium

5502 'monarch-envelope': Specifies the Monarch envelope
5503 'na-number-10-envelope': Specifies the North American number 10 business envelope medium
5504 'na-7x9-envelope': Specifies the North American 7x9 inch envelope
5505 'na-9x11-envelope': Specifies the North American 9x11 inch envelope
5506 'na-10x14-envelope': Specifies the North American 10x14 inch envelope
5507 'na-number-9-envelope': Specifies the North American number 9 business envelope
5508 'na-6x9-envelope': Specifies the North American 6x9 inch envelope
5509 'na-10x15-envelope': Specifies the North American 10x15 inch envelope
5510

5511 The following standard values are defined for the less commonly used media (white-only):

5512 'executive-white': Specifies the white executive medium
5513 'folio-white': Specifies the folio white medium
5514 'invoice-white': Specifies the white invoice medium
5515 'ledger-white': Specifies the white ledger medium
5516 'quarto-white': Specified the white quarto medium
5517 'iso-a0-white': Specifies the ISO A0 white medium
5518 'iso-a1-white': Specifies the ISO A1 white medium
5519 'iso-a2-white': Specifies the ISO A2 white medium
5520 'iso-a6-white': Specifies the ISO A6 white medium
5521 'iso-a7-white': Specifies the ISO A7 white medium
5522 'iso-a8-white': Specifies the ISO A8 white medium
5523 'iso-a9-white': Specifies the ISO A9 white medium
5524 'iso-10-white': Specifies the ISO A10 white medium
5525 'iso-b0-white': Specifies the ISO B0 white medium
5526 'iso-b1-white': Specifies the ISO B1 white medium
5527 'iso-b2-white': Specifies the ISO B2 white medium
5528 'iso-b3-white': Specifies the ISO B3 white medium
5529 'iso-b6-white': Specifies the ISO B6 white medium
5530 'iso-b7-white': Specifies the ISO B7 white medium
5531 'iso-b8-white': Specifies the ISO B8 white medium
5532 'iso-b9-white': Specifies the ISO B9 white medium
5533 'iso-b10-white': Specifies the ISO B10 white medium
5534 'jis-b0-white': Specifies the JIS B0 white medium
5535 'jis-b1-white': Specifies the JIS B1 white medium
5536 'jis-b2-white': Specifies the JIS B2 white medium
5537 'jis-b3-white': Specifies the JIS B3 white medium
5538 'jis-b6-white': Specifies the JIS B6 white medium
5539 'jis-b7-white': Specifies the JIS B7 white medium
5540 'jis-b8-white': Specifies the JIS B8 white medium
5541 'jis-b9-white': Specifies the JIS B9 white medium
5542 'jis-b10-white': Specifies the JIS B10 white medium
5543

5544 The following standard values are defined for engineering media (white only):

5545 'a-white': Specifies the engineering A size medium
5546 'b-white': Specifies the engineering B size medium
5547 'c-white': Specifies the engineering C size medium
5548 'd-white': Specifies the engineering D size medium
5549 'e-white': Specifies the engineering E size medium
5550

5551 The following standard values are defined for input-trays (from ISO DPA and the Printer MIB):

5552 'top': The top input tray in the printer.
5553 'middle': The middle input tray in the printer.
5554 'bottom': The bottom input tray in the printer.
5555 'envelope': The envelope input tray in the printer.
5556 'manual': The manual feed input tray in the printer.
5557 'large-capacity': The large capacity input tray in the printer.
5558 'main': The main input tray
5559 'side': The side input tray
5560

5561 The following standard values are defined for media sizes (from ISO DPA):

5562 'iso-a0': Specifies the ISO A0 size: 841 mm by 1189 mm as defined in ISO 216
5563 'iso-a1': Specifies the ISO A1 size: 594 mm by 841 mm as defined in ISO 216
5564 'iso-a2': Specifies the ISO A2 size: 420 mm by 594 mm as defined in ISO 216
5565 'iso-a3': Specifies the ISO A3 size: 297 mm by 420 mm as defined in ISO 216
5566 'iso-a4': Specifies the ISO A4 size: 210 mm by 297 mm as defined in ISO 216
5567 'iso-a5': Specifies the ISO A5 size: 148 mm by 210 mm as defined in ISO 216
5568 'iso-a6': Specifies the ISO A6 size: 105 mm by 148 mm as defined in ISO 216
5569 'iso-a7': Specifies the ISO A7 size: 74 mm by 105 mm as defined in ISO 216
5570 'iso-a8': Specifies the ISO A8 size: 52 mm by 74 mm as defined in ISO 216
5571 'iso-a9': Specifies the ISO A9 size: 37 mm by 52 mm as defined in ISO 216
5572 'iso-a10': Specifies the ISO A10 size: 26 mm by 37 mm as defined in ISO 216
5573 'iso-b0': Specifies the ISO B0 size: 1000 mm by 1414 mm as defined in ISO 216
5574 'iso-b1': Specifies the ISO B1 size: 707 mm by 1000 mm as defined in ISO 216
5575 'iso-b2': Specifies the ISO B2 size: 500 mm by 707 mm as defined in ISO 216
5576 'iso-b3': Specifies the ISO B3 size: 353 mm by 500 mm as defined in ISO 216
5577 'iso-b4': Specifies the ISO B4 size: 250 mm by 353 mm as defined in ISO 216
5578 'iso-b5': Specifies the ISO B5 size: 176 mm by 250 mm as defined in ISO 216
5579 'iso-b6': Specifies the ISO B6 size: 125 mm by 176 mm as defined in ISO 216
5580 'iso-b7': Specifies the ISO B7 size: 88 mm by 125 mm as defined in ISO 216
5581 'iso-b8': Specifies the ISO B8 size: 62 mm by 88 mm as defined in ISO 216
5582 'iso-b9': Specifies the ISO B9 size: 44 mm by 62 mm as defined in ISO 216
5583 'iso-b10': Specifies the ISO B10 size: 31 mm by 44 mm as defined in ISO 216
5584 'na-letter': Specifies the North American letter size: 8.5 inches by 11 inches
5585 'na-legal': Specifies the North American legal size: 8.5 inches by 14 inches
5586 'executive': Specifies the executive size (7.25 X 10.5 in)
5587 'folio': Specifies the folio size (8.5 X 13 in)

5588 'invoice': Specifies the invoice size (5.5 X 8.5 in)
 5589 'ledger': Specifies the ledger size (11 X 17 in)
 5590 'quarto': Specifies the quarto size (8.5 X 10.83 in)
 5591 'iso-c3': Specifies the ISO C3 size: 324 mm by 458 mm as defined in ISO 269
 5592 'iso-c4': Specifies the ISO C4 size: 229 mm by 324 mm as defined in ISO 269
 5593 'iso-c5': Specifies the ISO C5 size: 162 mm by 229 mm as defined in ISO 269
 5594 'iso-c6': Specifies the ISO C6 size: 114 mm by 162 mm as defined in ISO 269
 5595 'iso-designated-long': Specifies the ISO Designated Long size: 110 mm by 220 mm as defined in ISO
 5596 269
 5597 'na-10x13-envelope': Specifies the North American 10x13 size: 10 inches by 13 inches
 5598 'na-9x12-envelope': Specifies the North American 9x12 size: 9 inches by 12 inches
 5599 'na-number-10-envelope': Specifies the North American number 10 business envelope size: 4.125
 5600 inches by 9.5 inches
 5601 'na-7x9-envelope': Specifies the North American 7x9 inch envelope size
 5602 'na-9x11-envelope': Specifies the North American 9x11 inch envelope size
 5603 'na-10x14-envelope': Specifies the North American 10x14 inch envelope size
 5604 'na-number-9-envelope': Specifies the North American number 9 business envelope size
 5605 'na-6x9-envelope': Specifies the North American 6x9 envelope size
 5606 'na-10x15-envelope': Specifies the North American 10x15 envelope size
 5607 'monarch-envelope': Specifies the Monarch envelope size (3.87 x 7.5 in)
 5608 'jis-b0': Specifies the JIS B0 size: 1030mm x 1456mm
 5609 'jis-b1': Specifies the JIS B1 size: 728mm x 1030mm
 5610 'jis-b2': Specifies the JIS B2 size: 515mm x 728mm
 5611 'jis-b3': Specifies the JIS B3 size: 364mm x 515mm
 5612 'jis-b4': Specifies the JIS B4 size: 257mm x 364mm
 5613 'jis-b5': Specifies the JIS B5 size: 182mm x 257mm
 5614 'jis-b6': Specifies the JIS B6 size: 128mm x 182mm
 5615 'jis-b7': Specifies the JIS B7 size: 91mm x 128mm
 5616 'jis-b8': Specifies the JIS B8 size: 64mm x 91mm
 5617 'jis-b9': Specifies the JIS B9 size: 45mm x 64mm
 5618 'jis-b10': Specifies the JIS B10 size: 32mm x 45mm

5619 The following standard values are defined for engineering media sizes:

5620 'a': Specifies the engineering A size: 8.5 inches x 11 inches
 5621 'b': Specifies the engineering B size: 11 inches x 17 inches
 5622 'c': Specifies the engineering C size: 17 inches x 22 inches
 5623 'd': Specifies the engineering D size: 22 inches x 34 inches
 5624 'e': Specifies the engineering E size: 34 inches x 44 inches
 5625

5626 15. APPENDIX D: Processing IPP Attributes

5627 When submitting a print job to a Printer object, the IPP model allows a client to supply operation and Job
 5628 Template attributes along with the document data. These Job Template attributes in the create request

5629 affect the rendering, production and finishing of the documents in the job. Similar types of instructions
5630 may also be contained in the document to be printed, that is, embedded within the print data itself. In
5631 addition, the Printer has a set of attributes that describe what rendering and finishing options which are
5632 supported by that Printer. This model, which allows for flexibility and power, also introduces the potential
5633 that at job submission time, these client-supplied attributes may conflict with either:

- 5634 - what the implementation is capable of realizing (i.e., what the Printer supports), as well as
- 5635 - the instructions embedded within the print data itself.

5636

5637 The following sections describe how these two types of conflicts are handled in the IPP model.

5638 15.1 Fidelity

5639 If there is a conflict between what the client requests and what a Printer object supports, the client may
5640 request one of two possible conflict handling mechanisms:

- 5641 1) either reject the job since the job can not be processed exactly as specified, or
- 5642 2) allow the Printer to make any changes necessary to proceed with processing the Job the best it can.

5643

5644 In the first case the client is indicating to the Printer object: "Print the job exactly as specified with no
5645 exceptions, and if that can't be done, don't even bother printing the job at all." In the second case, the client
5646 is indicating to the Printer object: "It is more important to make sure the job is printed rather than be
5647 processed exactly as specified; just make sure the job is printed even if client supplied attributes need to be
5648 changed or ignored."

5649 The IPP model accounts for this situation by introducing an "ipp-attribute-fidelity" attribute.

5650 In a create request, "ipp-attribute-fidelity" is a boolean operation attribute that is **OPTIONALLY** supplied
5651 by the client. The value 'true' indicates that total fidelity to client supplied Job Template attributes and
5652 values is required. The client is requesting that the Job be printed exactly as specified, and if that is not
5653 possible then the job **MUST** be rejected rather than processed incorrectly. The value 'false' indicates that a
5654 reasonable attempt to print the Job is acceptable. If a Printer does not support some of the client supplied
5655 Job Template attributes or values, the Printer **MUST** ignore them or substitute any supported value for
5656 unsupported values, respectively. The Printer may choose to substitute the default value associated with
5657 that attribute, or use some other supported value that is similar to the unsupported requested value. For
5658 example, if a client supplies a "media" value of 'na-letter', the Printer may choose to substitute 'iso-a4' rather
5659 than a default value of 'envelope'. If the client does not supply the "ipp-attribute-fidelity" attribute, the
5660 Printer assumes a value of 'false'.

5661 Each Printer implementation **MUST** support both types of "fidelity" printing (that is whether the client
5662 supplies a value of 'true' or 'false');

- 5663 - If the client supplies 'false' or does not supply the attribute, the Printer object **MUST** always accept the
5664 request by ignoring unsupported Job Template attributes and by substituting unsupported values of
5665 supported Job Template attributes with supported values.

5666 - If the client supplies 'true', the Printer object MUST reject the request if the client supplies
5667 unsupported Job Template attributes.
5668

5669 Since a client can always query a Printer to find out exactly what is and is not supported, "ipp-attribute-
5670 fidelity" set to 'false' is useful when:

- 5671 1) The End-User uses a command line interface to request attributes that might not be supported.
- 5672 2) In a GUI context, if the End User expects the job might be moved to another printer and prefers a
5673 sub-optimal result to nothing at all.
- 5674 3) The End User just wants something reasonable in lieu of nothing at all.
5675

5676 15.2 Page Description Language (PDL) Override

5677 If there is a conflict between the value of an IPP Job Template attribute and a corresponding instruction in
5678 the document data, the value of the IPP attribute SHOULD take precedence over the document instruction.
5679 Consider the case where a previously formatted file of document data is sent to an IPP Printer. In this case,
5680 if the client supplies any attributes at job submission time, the client desires that those attributes override
5681 the embedded instructions. Consider the case where a previously formatted document has embedded in it
5682 commands to load 'iso-a4' media. However, the document is passed to an end user that only has access to a
5683 printer with 'na-letter' media loaded. That end user most likely wants to submit that document to an IPP
5684 Printer with the "media" Job Template attribute set to 'na-letter'. The job submission attribute should take
5685 precedence over the embedded PDL instruction. However, until companies that supply document data
5686 interpreters allow a way for external IPP attributes to take precedence over embedded job production
5687 instructions, a Printer might not be able to support the semantics that IPP attributes override the embedded
5688 instructions.

5689 The IPP model accounts for this situation by introducing a "pdl-override-supported" attribute that describes
5690 the Printer objects capabilities to override instructions embedded in the PDL data stream. The value of the
5691 "pdl-override-supported" attribute is configured by means outside the scope of this IPP/1.1 document.

5692 This REQUIRED Printer attribute takes on the following values:

- 5693 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values take
5694 precedence over embedded instructions in the document data, however there is no guarantee.
- 5695 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP attribute
5696 values take precedence over embedded instructions in the document data.
5697

5698 At job processing time, an implementation that supports the value of 'attempted' might do one of several
5699 different actions:

- 5700 1) Generate an output device specific command sequence to realize the feature represented by the IPP
5701 attribute value.
- 5702 2) Parse the document data itself and replace the conflicting embedded instruction with a new
5703 embedded instruction that matches the intent of the IPP attribute value.

- 5704 3) Indicate to the Printer that external supplied attributes take precedence over embedded instructions
5705 and then pass the external IPP attribute values to the document data interpreter.
5706 4) Anything else that allows for the semantics that IPP attributes override embedded document data
5707 instructions.
5708

5709 Since 'attempted' does not offer any type of guarantee, even though a given Printer object might not do a
5710 very "good" job of attempting to ensure that IPP attributes take a higher precedence over instructions
5711 embedded in the document data, it would still be a conforming implementation.

5712 At job processing time, an implementation that supports the value of 'not-attempted' might do one of the
5713 following actions:

- 5714 1) Simply pre-pend the document data with the PDL instruction that corresponds to the client-supplied
5715 PDL attribute, such that if the document data also has the same PDL instruction, it will override
5716 what the Printer object pre-pended. In other words, this implementation is using the same
5717 implementation semantics for the client-supplied IPP attributes as for the Printer object defaults.
5718 2) Parse the document data and replace the conflicting embedded instruction with a new embedded
5719 instruction that approximates, but does not match, the semantic intent of the IPP attribute value.
5720

5721 Note: The "ipp-attribute-fidelity" attribute applies to the Printer's ability to either accept or reject other
5722 unsupported Job Template attributes. In other words, if "ipp-attribute-fidelity" is set to 'true', a Job is
5723 accepted if and only if the client supplied Job Template attributes and values are supported by the Printer.
5724 Whether these attributes actually affect the processing of the Job when the document data contains
5725 embedded instructions depends on the ability of the Printer to override the instructions embedded in the
5726 document data with the semantics of the IPP attributes. If the document data attributes can be overridden
5727 ("pdl-override-supported" set to 'attempted'), the Printer makes an attempt to use the IPP attributes when
5728 processing the Job. If the document data attributes can not be overridden ("pdl-override-supported" set to
5729 'not-attempted'), the Printer makes no attempt to override the embedded document data instructions with the
5730 IPP attributes when processing the Job, and hence, the IPP attributes may fail to affect the Job processing
5731 and output when the corresponding instruction is embedded in the document data.

5732 15.3 Using Job Template Attributes During Document Processing.

5733 The Printer object uses some of the Job object's Job Template attributes during the processing of the
5734 document data associated with that job. These include, but are not limited to, "orientation-requested",
5735 "number-up", "sides", "media", and "copies". The processing of each document in a Job Object MUST
5736 follow the steps below. These steps are intended only to identify when and how attributes are to be used in
5737 processing document data and any alternative steps that accomplishes the same effect can be used to
5738 implement this specification document.

- 5739 1. Using the client supplied "document-format" attribute or some form of document format detection
5740 algorithm (if the value of "document-format" is not specific enough), determine whether or not the
5741 document data has already been formatted for printing. If the document data has been formatted,
5742 then go to step 2. Otherwise, the document data MUST be formatted. The formatting detection
5743 algorithm is implementation defined and is not specified by this document. The formatting of the

5744 document data uses the "orientation-requested" attribute to determine how the formatted print data
5745 should be placed on a print-stream page, see section 4.2.10 for the details.
5746

- 5747 2. The document data is in the form of a print-stream in a known media type. The "page-ranges"
5748 attribute is used to select, as specified in section 4.2.7, a sub-sequence of the pages in the print-
5749 stream that are to be processed and images.
5750
- 5751 3. The input to this step is a sequence of print-stream pages. This step is controlled by the "number-up"
5752 attribute. If the value of "number-up" is N, then during the processing of the print-stream pages,
5753 each N print-stream pages are positioned, as specified in section 4.2.9, to create a single impression.
5754 If a given document does not have N more print-stream pages, then the completion of the
5755 impression is controlled by the "multiple-document-handling" attribute as described in section 4.2.4;
5756 when the value of this attribute is 'single-document' or 'single-document-new-sheet', the print-stream
5757 pages of document data from subsequent documents is used to complete the impression.
5758

5759 The size(scaling), position(translation) and rotation of the print-stream pages on the impression is
5760 implementation defined. Note that during this process the print-stream pages may be rendered to a
5761 form suitable for placing on the impression; this rendering is controlled by the values of the "printer-
5762 resolution" and "print-quality" attributes as described in sections 4.2.12 and 4.2.13. In the case N=1,
5763 the impression is nearly the same as the print-stream page; the differences would only be in the size,
5764 position and rotation of the print-stream page and/or any decoration, such as a frame to the page,
5765 that is added by the implementation.
5766

- 5767 4. The collection of impressions is placed, in sequence, onto sides of the media sheets. This placement
5768 is controlled by the "sides" attribute and the orientation of the print-stream page, as described in
5769 section 4.2.8. The orientation of the print-stream pages affects the orientation of the impression; for
5770 example, if "number-up" equals 2, then, typically, two portrait print-stream pages become one
5771 landscape impression. Note that the placement of impressions onto media sheets is also controlled
5772 by the "multiple-document-handling" attribute as described in section 4.2.4.
5773
- 5774 5. The "copies" and "multiple-document-handling" attributes are used to determine how many copies of
5775 each media instance are created and in what order. See sections 4.2.5 and 4.2.4 for the details.
5776
- 5777 6. When the correct number of copies are created, the media instances are finished according to the
5778 values of the "finishings" attribute as described in 4.2.6. Note that sometimes finishing operations
5779 may require manual intervention to perform the finishing operations on the copies, especially
5780 uncollated copies. This document allows any or all of the processing steps to be performed
5781 automatically or manually at the discretion of the Printer object.

5782 16. APPENDIX E: Generic Directory Schema

5783 This section defines a generic schema for an entry in a directory service. A directory service is a means by
5784 which service users can locate service providers. In IPP environments, this means that IPP Printers can be
5785 registered (either automatically or with the help of an administrator) as entries of type printer in the

5786 directory using an implementation specific mechanism such as entry attributes, entry type fields, specific
 5787 branches, etc. IPP clients can search or browse for entries of type printer. Clients use the directory service
 5788 to find entries based on naming, organizational contexts, or filtered searches on attribute values of entries.
 5789 For example, a client can find all printers in the "Local Department" context. Authentication and
 5790 authorization are also often part of a directory service so that an administrator can place limits on end users
 5791 so that they are only allowed to find entries to which they have certain access rights. IPP itself does not
 5792 require any specific directory service protocol or provider.

5793 Note: Some directory implementations allow for the notion of "aliasing". That is, one directory entry object
 5794 can appear as multiple directory entry object with different names for each object. In each case, each alias
 5795 refers to the same directory entry object which refers to a single IPP Printer object.

5796 The generic schema is a subset of IPP Printer Job Template and Printer Description attributes (sections 4.2
 5797 and 4.4). These attributes are identified as either RECOMMENDED or OPTIONAL for the directory entry
 5798 itself. This conformance labeling is NOT the same conformance labeling applied to the attributes of IPP
 5799 Printers objects. The conformance labeling in this Appendix is intended to apply to directory templates and
 5800 to IPP Printer implementations that subscribe by adding one or more entries to a directory.
 5801 RECOMMENDED attributes SHOULD be associated with each directory entry. OPTIONAL attributes
 5802 MAY be associated with the directory entry (if known or supported). In addition, all directory entry
 5803 attributes SHOULD reflect the current attribute values for the corresponding Printer object.

5804 The names of attributes in directory schema and entries SHOULD be the same as the IPP Printer attribute
 5805 names as shown.

5806 In order to bridge between the directory service and the IPP Printer object, one of the RECOMMENDED
 5807 directory entry attributes is the Printer object's "printer-uri-supported" attribute. The IPP client queries the
 5808 "printer-uri-supported" attribute in the directory entry and then addresses the IPP Printer object using one of
 5809 its URIs. The "uri-security-supported" attribute identifies the protocol (if any) used to secure a channel.

5810 The following attributes define the generic schema for directory entries of type PRINTER:

5811	printer-uri-supported	RECOMMENDED	Section 4.4.1
5812	uri-authentication-supported	RECOMMENDED	Section 4.4.2
5813	uri-security-supported	RECOMMENDED	Section 4.4.3
5814	printer-name	RECOMMENDED	Section 4.4.4
5815	printer-location	RECOMMENDED	Section 4.4.5
5816	printer-info	OPTIONAL	Section 4.4.6
5817	printer-more-info	OPTIONAL	Section 4.4.7
5818	printer-make-and-model	RECOMMENDED	Section 4.4.9
5819	ipp-versions-supported	RECOMMENDED	Section 4.4.14
5820	multiple-document-jobs-supported	OPTIONAL	Section 4.4.16
5821	charset-supported	OPTIONAL	Section 4.4.18
5822	generated-natural-language-		
5823	supported	OPTIONAL	Section 4.4.20
5824	document-format-supported	RECOMMENDED	Section 4.4.22
5825	color-supported	RECOMMENDED	Section 4.4.26
5826	compression-supported	RECOMMENDED	Section 4.4.32

5827	pages-per-minute	OPTIONAL	Section 4.4.36
5828	pages-per-minute-color	OPTIONAL	Section 4.4.37
5829			
5830	finishings-supported	OPTIONAL	Section 4.2.6
5831	number-up-supported	OPTIONAL	Section 4.2.7
5832	sides-supported	RECOMMENDED	Section 4.2.8
5833	media-supported	RECOMMENDED	Section 4.2.11
5834	printer-resolution-supported	OPTIONAL	Section 4.2.12
5835	print-quality-supported	OPTIONAL	Section 4.2.13

5836

5837 17. APPENDIX F: Differences between the IPP/1.0 and IPP/1.1 "Model and Semantics" Documents

5838 This Appendix is divided into two lists that summarize the differences between IPP/1.1 (this document) and
5839 IPP/1.0 [RFC2566]. The section numbers refer to the numbers in this document which in some cases have
5840 changed from RFC 2566. When a change affects multiple sections, the item is listed once in the order of
5841 the first section affected and the remaining affected section numbers are indicated.

5842 The first list contains extensions and clarifications and the second list contains changes in semantics or
5843 conformance. However, client and IPP object implementations of IPP/1.0 MAY implement any of the
5844 extensions and clarifications in this document.

5845 The following extensions and clarifications have been incorporated into this document:

- 5846 1. Section 2.1 - clarified that the term "client" can be either contained in software controlled by an end
5847 user or a part of a print server that controls devices. **Issue 4**
- 5848 2. Section 2 - clarified that the term "IPP object" and "Printer object" can either be embedded in a
5849 device object or part of a print server that accepts IPP requests. **Issue 4**
- 5850 3. Section 2.4 - added the description of the new "uri-authentication-supported" Printer Description
5851 attribute. **Issue 2**
- 5852 4. Section 3.1.3, 3.1.6, 3.2.5.2, and 3.2.6.2 - clarified the error handling for operation attributes that
5853 have their own status code. **Issues 18, 23, and 27**
- 5854 5. Section 3.1.6 - reorganized this section into sub-sections to separately describe "status-code",
5855 "status-message", "detailed-status-message", and "document-access-error" attributes. **Issue 18**
- 5856 6. Section 3.1.6.1 - clarified the error status codes and their relationship to operation attributes. **Issue**
5857 **18**
- 5858 7. Section 3.1.6.3 - Added the OPTIONAL "detailed-status-message (text(MAX))" operation attribute
5859 to provide additional more detailed information about a response. **Issue 35**
- 5860 8. Section 3.1.6.4 and 3.2.2 - Added the OPTIONAL "document-access-error (text(MAX))" operation
5861 attribute for use with Print-URI and Send-URI responses. **Issue 35**
- 5862 9. Sections 3.1.7 - Added this new section to clarify returning Unsupported Attributes for all
5863 operations, including only returning attributes that were in the request. Moved the text from section
5864 3.2.1.2 Unsupported Attributes to this section. **Issues 18, 23, and 27**
- 5865 10. Sections 3.1.7 and 4.1 - clarified the encoding of the "out-of-band" 'unsupported' and 'unknown'
5866 values. **Issues 12 and 15**
- 5867 11. Section 3.1.8 - clarified that only the version number parameter will be carried forward into future
5868 major or minor versions of the protocol.
- 5869 12. Section 3.1.8 - relaxed the requirements to increment the major version number in future versions of
5870 the Model and Semantics document. **Issue 33**
- 5871 13. Section 3.1.9, and 3.2.5 - added the 'processing' state to the list of job states that a job can be in after
5872 a Create-Job operation. **Issue 13**
- 5873 14. Section 3.1.9 - clarified that a non-spooling Printer MAY accept zero or more subsequent jobs while
5874 processing a job and flow control them down. Subsequent create requests are rejected with the
5875 'server-error-busy' error status. **Issue 20**

- 5876 15. Section 3.2.1.1 - clarified the validation of the "compression" operation attribute and its relationship
5877 to the validation of the "document-format" attribute and returning Unsupported Attributes. **Issues 6,**
5878 **Issue 11, and Issue 28**
- 5879 16. Sections 3.2.1.1, 4.3.8, 13.1.4.16, and 13.1.4.17 - added the 'client-error-compression-not-
5880 supported', 'client-error-compression-error' status codes and the 'unsupported-compression' and
5881 'compression-error' job-state-reasons. **Issue 28**
- 5882 17. Sections 3.2.1.1 and 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job-
5883 state-reasons. **Issue 3**
- 5884 18. Sections 3.2.2, 4.3.8 and 13.1.4.19 - added 'client-error-document-access-error' status code and
5885 'document-access-error' job state reason. **Issue 35**
- 5886 19. Section 3.2.5.2 and 3.2.6.2 - clarified that the Unsupported Attributes group MUST NOT include
5887 attributes not requested in the Get-Printer-Attributes request. **Issue 23**
- 5888 20. Section 3.2.6 - clarified that "limit" takes precedence over "which-jobs" and "my-jobs". **Issue 8**
- 5889 21. Section 3.2.6.2 - clarified that Get-Jobs returns 'successful-ok' when no jobs to return. **Issue 24**
- 5890 22. Sections 3.2.7, 3.2.8, and 3.2.9 - added the OPTIONAL Pause-Printer, Resume-Printer, and Purge-
5891 Jobs operations
- 5892 23. Section 3.3.1 - clarified that the authorization required for a Send-Document request MUST be the
5893 same user as the Create-Job or an operator. **Issue 19**
- 5894 24. Sections 3.3.5, 3.3.6, and 3.3.7 - added the OPTIONAL Hold-Job, Release-Job, and Restart-Job
5895 operations.
- 5896 25. Section 4.1 - clarified that the encoding of the out-of-band values are specified in the Encoding and
5897 Transport" document. **Issue 12 and Issue 15**
- 5898 26. Section 4.1.9.1 - clarified that 'application/octet-stream' auto-sensing can happen at create request
5899 time and/or job/document processing time. **Issue 9 and Issue 10**
- 5900 27. Section 4.1.14 - clarified that the localization of dateTime by the client includes the time zone.
5901 **Issue 17**
- 5902 28. Section 4.2 - clarified that xxx-supported have multiple keywords and/or names by adding
5903 parentheses to the table to give: (1setOf (type3 keyword | name))
- 5904 29. Section 4.2.2 - added the 'indefinite' keyword value to the "job-hold-until" attribute for use with the
5905 create operations and Hold-Job and Restart-Job operations.
- 5906 30. Section 4.2.6 - added more enum values to the "finishings" Job Template attribute.
- 5907 31. Section 4.3.7 - added that a forwarding server that cannot get any job state MAY return the job's
5908 state as 'completed', provided that it also return the new 'queued-in-device' job state reason. **Issue 14**
- 5909 32. Section 4.3.7.2 - added the Partitioning of Job States section to clarify the concepts of Job
5910 Retention, Job History, and Job Removal.
- 5911 33. Section 4.3.8 - added 'job-data-insufficient' job state reason to indicate whether sufficient data has
5912 arrived for the document to start to be processed. **Issue 13**
- 5913 34. Section 4.3.8 - added 'document-access-error' job state reason to indicate an access error of any kind.
5914 **Issue 35**
- 5915 35. Section 4.3.8 - added 'job-queued-for-marker' job state reason to indicate whether the job has
5916 completed some processing and is waiting for the marker. **Issue 31**
- 5917 36. Section 4.3.8 - added 'unsupported-compression' and 'compression-error' job state reasons to
5918 indicate compression not supported or compression processing error after the create has been
5919 accepted. **Issue 6**

- 5920 37. Section 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job state reasons
5921 to indicate document not supported or document format processing error after the create has been
5922 accepted. [Issue 3](#)
- 5923 38. Section 4.3.8 - added 'queued-in-device' job state reason to indicate that a job as been forwarded to a
5924 print system or device that does not provide any job status. [Issue 14](#)
- 5925 39. Section 4.3.10 - added "job-detailed-status-messages (1setOf text(MAX)) for returning detailed
5926 error messages. [Issue 35](#)
- 5927 40. Section 4.3.11 - added the "job-document-access-errors (1setOf text(MAX)) [Issue 35](#)
- 5928 41. Section 4.3.14.2 - clarified that the time recorded is the first time processing since the create
5929 operation or the Restart-Job operation. [Issue 17](#)
- 5930 42. Section 4.3.14.2 and 4.3.14.3 - clarified that the out-of-band value 'no-value' is returned if the job
5931 has not started processing or has not completed, respectively. [Issue 17](#)
- 5932 43. Section 4.3.14 - Added the OPTIONAL "date-time-at-creation", "date-time-at-processing", and
5933 "date-time-at-completed" Event Time Job Description attributes [Issue 17](#)
- 5934 44. Section 4.4.3 - added the 'tls' value to "uri-security-supported" attribute.
- 5935 45. Section 4.4.3 - clarified "uri-security-supported" is orthogonal to Client Authentication so that 'none'
5936 does not exclude Client Authentication. [Issue 2](#)
- 5937 46. Section 4.4.11 - simplified the "printer-state" descriptions while generalizing to allow high end
5938 devices that interpret one or more jobs while marking another. Indicated that 'spool-area-full' and
5939 'stopped-partly' "printer-state-reasons" may be used to provide further state information. [Issue 31](#)
- 5940 47. Section 4.4.12 - added the 'moving-to-paused' keyword value to the "printer-state-reasons" attribute
5941 for use with the Pause-Job operation.
- 5942 48. Section 4.4.12 - replaced the duplicate 'marker-supply-low' keyword with the missing 'toner-empty'
5943 keyword for the "printer-state-reasons" attribute. (This correction was also made before RFC 2566
5944 was published).
- 5945 49. Section 4.4.12 - clarified 'spool-area-full' "printer-state-reasons" to include non-spooling printers to
5946 indicate when it can and cannot accept another job. [Issue 20](#)
- 5947 50. Section 4.4.15 - added the enum values to the "operations-supported" attribute for the new
5948 operations. Clarified that the values of this attribute are encoded as any enum, namely 32-bit values.
- 5949 51. Section 4.4.30 - clarified that the dateTime value of "printer-current-time" is on a "best efforts
5950 basis". If a proper date-time cannot be obtained, the implementation returns the 'no-value' out-of-
5951 band value. Also clarified that the time zone NEED NOT be the time zone that the people near the
5952 device use and that the client SHOULD display the dateTime attributes in the user's local time.
5953 [Issue 17](#)
- 5954 52. Sections 4.4.36 and 4.4.37 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-
5955 color" Printer Description attributes.
- 5956 53. Section 5.1 - clarified that the client conformance requirements apply to clients controlled by an end
5957 user and clients in servers. [Issue 4](#)
- 5958 54. Section 5.1 - clarified that any response MAY contain additional attribute groups, attributes,
5959 attribute syntaxes, or attribute values. [Issue 25 and Issue 26](#)
- 5960 55. Section 5.1 - clarified that a client SHOULD do its best to prevent a channel from being closed by a
5961 lower layer when the channel is flow controlled off by the IPP Printer. [Issue 4 and Issue 5](#)
- 5962 56. Section 5.2 - clarified that the IPP object requirements apply to objects embedded in devices or that
5963 are parts of servers. [Issue 4](#)

- 5964 57. Section 5.2.2 - clarified that IPP objects MAY return operation responses that contain attribute
5965 groups, attribute names, attribute syntaxes, attribute values, and status codes that are extensions to
5966 this standard. **Issue 26**
- 5967 58. Section 8.3 - clarified the use of URIs for each Client Authentication mechanism.
- 5968 59. Section 8.5 - added the security discussion around the new operator/administrator operations.
- 5969 60. Section 13.1.4.16 - added client-error-compression-not-supported (0x040F) **Issue 6**
- 5970 61. Section 13.1.4.17 - added client-error-compression-error (0x0410) **Issue 6**
- 5971 62. Section 13.1.4.18 - added client-error-document-format-error (0x0411) **Issue 28**
- 5972 63. Section 13.1.4.19 - added client-error-document-access-error (0x0412) **Issue 35**
- 5973 64. Section 13.1.5.10 - added server-error-multiple-document-jobs-not-supported (0x0509) **Issue 34**
- 5974 65. Section 14 - added 'a-white', 'b-white', 'c-white', 'd-white', and 'e-white' and clarified that the existing
5975 'a', 'b', 'c', 'd', and 'e' values are size values.
- 5976 66. Section 16 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-color" Printer
5977 attributes to the Directory schema.
- 5978 67. Section 16 - added OPTIONAL "multiple-document-jobs-supported" to the Directory schema. **Issue**
5979 **34**
- 5980 68. Section 16 - added RECOMMENDED "uri-authentication-supported", "ipp-versions-supported",
5981 and "compression-supported" to the Directory schema. **Issue 2, Issue 36, and Issue 28**

5982 The following changes in semantics and/or conformance have been incorporated into this document:

- 5983 1. Section 3.1.8, 5.2.4, and 13.1.5.4 - Clients and IPP objects MUST support version 1.1 conformance
5984 requirements and SHOULD support version 1.0 conformance requirements. Also clarified that IPP
5985 Printers MUST accept '1.1' requests and SHOULD accept '1.x' requests. **Issue 33 and Issue 36**
- 5986 2. Section 3.2.1.1 and section 4.4.32 - changed the "compression" operation and the "compression-
5987 supported" Printer Description attribute from OPTIONAL to REQUIRED. **Issue 28**
- 5988 3. Sections 3.2.1.2 and 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED,
5989 so that "job-state-reasons" MUST be returned in create operation responses. **Issue 30**
- 5990 4. Sections 3.2.4, 3.3.1, 4.4.16, and 16 - changed Create-Job/Send-Document so that they MAY be
5991 implemented while only supporting one document jobs. Added the "multiple-document-jobs-
5992 supported" boolean Printer Description attribute to indicate whether Create-Job/Send-Document
5993 support multiple document jobs or not. Added to the Directory schema. **Issue 34**
- 5994 5. Section 4.1.9 - deleted 'text/plain; charset=iso-10646-ucs-2', since binary is not legal with the 'text'
5995 type.
- 5996 6. Section 4.2.4 - indicated that the "multiple-document-handling" Job Template attribute MUST be
5997 supported with at least one value if the Printer supports multiple documents per job **Issue 34**
- 5998 7. Section 4.3.7.2 - indicated that the 'job-restartable' job state reason SHOULD be supported if the
5999 Restart-Job operation is supported. **Issue 30**
- 6000 8. Section 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED. **Issue 30**
- 6001 9. Section 4.3.8 - clarified the conformance of the values of the "job-state-reasons" attribute by
6002 copying conformance requirements from other sections of the document so that it is clear from
6003 reading the definition of "job-state-reasons" which values MUST or SHOULD be supported. The
6004 'none', 'unsupported-compression', and 'unsupported-document-format' values MUST be supported.
6005 The "job-hold-until-specified" MUST be specified if the "job-hold-until" Job Template is supported.
6006 The following values SHOULD be supported: 'job-canceled-by-user', 'aborted-by-system', and 'job-
6007 completed-successfully'. The 'job-canceled-by-operator' SHOULD be supported if the

- 6008 implementation permits canceling by other than the job owner. The 'job-canceled-at-device'
6009 SHOULD be supported if the device supports canceling jobs at the console. The 'job-completed-
6010 with-warnings' SHOULD be supported, if the implementation detects warnings. The 'job-
6011 completed-with-errors' SHOULD be supported if the implementation detects errors. The 'job-
6012 restartable' SHOULD be supported if the Restart-Job operation is supported. **Issue 30**
- 6013 10. Section 4.3.14 - changed the "time-at-creation", "time-at-processing", and "time-at-completed"
6014 Event Time Job Description attributes from OPTIONAL to REQUIRED. **Issue 17**
 - 6015 11. Section 4.3.14.4 - added the REQUIRED "job-printer-up-time (integer(1:MAX))" Job Description
6016 attribute as an alias for "printer-up-time" to reduce number of operations to get job times. **Issue 17**
 - 6017 12. Section 4.4.2 - added the REQUIRED "uri-authentication-supported (1setOf type2 keyword)"
6018 Printer Description attribute to describe the Client Authentication used by each Printer URI. **Issue 2**
 - 6019 13. Section 4.4.12 - changed "printer-state-reasons" Printer Description attribute from OPTIONAL to
6020 REQUIRED. **Issue 30**
 - 6021 14. Section 4.4.12 - changed 'paused' value of "printer-state-reasons" to MUST if Pause-Printer
6022 operation is supported. **Issue 30**
 - 6023 **15.** Section 4.4.14 - added the REQUIRED "ipp-versions-supported (1setOf keyword)" Printer
6024 Description attribute, since IPP/1.1 Printers do not have to support version '1.0' conformance
6025 requirements. **Issue 36**
 - 6026 16. Section 4.4.16 - added the "multiple-document-jobs-supported (boolean)" Printer Description
6027 attribute so that a client can tell whether a Printer that supports Create-Job/Send-Document supports
6028 multiple document jobs or not. This attribute is REQUIRED if the Create-Job operation is
6029 supported. **Issue 34**
 - 6030 17. Section 4.4.24 - changed the "queued-job-count" Printer Description attribute from
6031 RECOMMENDED to REQUIRED. **Issue 29**
 - 6032 18. Section 4.4.32 - changed "compression-supported (1setOf type3 keyword)" Printer Description
6033 attribute from OPTIONAL to REQUIRED. **Issue 28**
 - 6034 19. Section 5.1 - changed the client security requirements from RECOMMENDED non-standards track
6035 SSL3 to MUST support Client Authentication as defined in the IPP/1.1 Encoding and Transport
6036 document [IPP-PRO]. A client SHOULD support Operation Privacy and Server Authentication as
6037 defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. **Issue 32**
 - 6038 20. Section 5.2.7 - changed the IPP object security requirements from OPTIONAL non-standards track
6039 SSL3 to SHOULD contain support for Client Authentication as defined in the IPP/1.1 Encoding and
6040 Transport document [IPP-PRO]. A Printer implementation MAY allow an administrator to
6041 configure the Printer so that all, some, or none of the users are authenticated. An IPP Printer
6042 implementation SHOULD contain support for Operation Privacy and Server Authentication as
6043 defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation
6044 MAY allow an administrator to configure the degree of support for Operation Privacy and Server
6045 Authentication. Security MUST NOT be compromised when the client supplies a lower version-
6046 number in a request. **Issue 32**

6047 See also the "IPP/1.1 Encoding and Transport" [IPP-PRO] document for differences between IPP/1.0
6048 [RFC2565] and IPP/1.1 [IPP-PRO].
