8 Internet Printing Protocol/1.1: **The 'ipp-ntfy' Notification Delivery Method and Protocol**

9 Copyright (C) The Internet Society (1999). All Rights Reserved.

10 **ISSUE 01 - What should the name of this delivery method and protocol be that we use in the title of this**  
11 **document?**

12 **ISSUE 02 - What should the scheme name be? Consider 'ipp-ntfy' a working title, until we see several**  
13 **schemes. The 'ipp-get' delivery method is another example. Should the scheme name somehow include**  
14 **"notification", i.e., 'ntfy'? How about 'ipp-ntfy-send' or 'ipp-ntfy-push' and 'ipp-ntfy-get' or 'ipp-ntfy-pull' to**  
15 **go with the Send-Notifications and Get-Notifications operations, respectively?**

16 **ISSUE 03 - Should the scheme name be used in the title?**

17 Status of this Memo

18 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of  
19 [rfc2026]. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas,  
20 and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

21 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or  
22 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or  
23 to cite them other than as "work in progress".

24 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

25 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

26 **Abstract**

27 The IPP event notification specification [ipp-ntfy] is an OPTIONAL extension to IPP/1.0 and IPP/1.1.  
28 [ipp-ntfy] requires the definition of one or more delivery methods for dispatching event notification reports  
29 to Notification Recipients. This document describes the semantics and syntax of the 'ipp-ntfy' event  
30 notification delivery method that is itself a request/response protocol. For this delivery method, an IPP  
31 Printer sends (pushes) IPP event Notifications to the Notification Recipients using the protocol defined  
32 herein which includes HTTP as a transport.

33 The full set of IPP documents includes:

34 Design Goals for an Internet Printing Protocol [RFC2567]

35 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]

36 Internet Printing Protocol/1.1: Model and Semantics (this document)

37 Internet Printing Protocol/1.1: Encoding and Transport [ipp-pro]

38 Internet Printing Protocol/1.1: Implementer's Guide [ipp-iig]

39 Mapping between LPD and IPP Protocols [RFC2569]

40

41 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed printing  
42 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included  
43 in a printing protocol for the Internet. It identifies requirements for three types of users: end users,  
44 operators, and administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0. A  
45 few OPTIONAL operator operations have been added to IPP/1.1.

46 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document  
47 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of  
48 IPP specification documents, and gives background and rationale for the IETF working group's major  
49 decisions.

50 The "Internet Printing Protocol/1.1: Encoding and Transport" document is a formal mapping of the abstract  
51 operations and attributes defined in the model document onto HTTP/1.1 [RFC2616]. It defines the  
52 encoding rules for a new Internet MIME media type called "application/ipp". This document also defines  
53 the rules for transporting a message body over HTTP whose Content-Type is "application/ipp". This  
54 document defines a new scheme named 'ipp' for identifying IPP printers and jobs.

55 The "Internet Printing Protocol/1.1: Implementer's Guide" document gives insight and advice to  
56 implementers of IPP clients and IPP objects. It is intended to help them understand IPP/1.1 and some of the  
57 considerations that may assist them in the design of their client and/or IPP object implementations. For  
58 example, a typical order of processing requests is given, including error checking. Motivation for some of  
59 the specification decisions is also included.

60 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of gateways  
61 between IPP and LPD (Line Printer Daemon) implementations.

## 88 1 Introduction

89 IPP Printers that support the OPTIONAL IPP event notification extension [ipp-ntfy] either a) accept, store,  
90 and use notification Subscriptions to generate notification reports and implement one or more delivery  
91 methods for notifying interested parties, or b) support a subset of these tasks and farm out the remaining  
92 tasks to a Notification Delivery Service. The 'ipp-ntfy' event notification delivery method specified in this  
93 document is itself a request/response protocol that may be used in a variety of notification scenarios. Its  
94 primary intended use is for IPP Printers to send (push) event notifications to Notification Recipients using  
95 the IPP Send-Notifications operation over HTTP. However, it may also be used by IPP Printers to send  
96 notification to Notification Services and by Notification Delivery Services to send notifications to the  
97 Ultimate Notification Recipients (see [ipp-ntfy]). Furthermore, this protocol can be extended in the future  
98 to add other operations, such as querying a Notification Recipient for its capabilities.

## 99 2 Terminology

100 This document uses terms such as "attributes", "keywords", and "support". These terms have special  
101 meaning and are defined in the model terminology [ipp-mod] section 12.2.

102 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT, MAY, NEED  
103 NOT, and OPTIONAL, have special meaning relating to conformance. These terms are defined in [ipp-  
104 mod] section 12.1 on conformance terminology, most of which is taken from RFC 2119 [RFC2119].

105 This section defines the following additional terms that are used throughout this document:

106       REQUIRED: if an implementation supports the extensions described in this document, it MUST  
107       support a REQUIRED feature.

108       OPTIONAL: if an implementation supports the extensions described in this document, it MAY support  
109       an OPTIONAL feature.

110       Event Notification (Notification for short) - See [ip-ntfy]

111       Notification Source - See [ipp-ntfy]

112       Notification Recipient - See [ipp-ntfy]

113       Subscription object - See [ipp-ntfy]

114       Ultimate Notification Recipient - See [ipp-ntfy]

## 115 3 Model and Operation

116 In the IPP Notification Model [ipp-ntfy], one or more Per-Job Subscriptions can be supplied in the Job  
117 Creation operation or OPTIONALLY as subsequent Create-Job-Subscription operations; one Per-Printer  
118 Subscription can be supplied in the Create-Printer operation. The client that creates these Subscription  
119 objects becomes the owner of the Subscription object.

120 When creating each Subscription object, the client supplies the "notify-recipient" (uri) attribute. The  
121 "notify-recipient" attribute specifies both a single Notification Recipient that is to receive the Notifications

122 when subsequent events occur and the method for notification delivery that the IPP Printer is to use. For  
123 the Notification delivery method defined in this document, the notification method is 'ipp-ntfy' and the rest  
124 of the URI is the address of the Notification Recipient to which the IPP Printer will send the Send-  
125 Notifications operations using HTTP as a transport.

126 The 'ipp-ntfy' event notification delivery method defined in this document is also a client/server protocol.  
127 The "client" in this HTTP relationship is the Notification Source described in [ipp-ntfy] while the "server"  
128 is the Notification Recipient. The Notification Source invokes the Send-Notifications operation supported  
129 by the 'ipp-ntfy' notification protocol to communicate IPP event Notification contents to the Notification  
130 Recipient. The Notification Recipient only conveys information to the Notification Source in the form of  
131 responses to the operations initiated by the Notification Source.

132 All requests defined for this protocol will be issued as HTTP POST operations and their corresponding  
133 HTTP notification responses will be returned in the responses to those HTTP POST operations. Hence,  
134 Notification Sources that implement the 'ipp-ntfy' delivery method and protocol will need to include an  
135 HTTP client stack while notification recipients that implement this protocol will need to support an HTTP  
136 server stack (see section 6 for more details).

## 137 4 Notification Operations

138 The Notification Source composes the information defined for an IPP Notification [ipp-ntfy] and sends it  
139 using the Sent-Notifications operation to the Notification Recipient supplied in the Subscription object.

140 The 'ipp-ntfy' delivery method and notification protocol makes extensive use of the operations model  
141 defined by IPP [rfc2566]. This includes, the use of a URI as the identifier for the target of each operation,  
142 the inclusion of a version number, operation-id, and request-id in each request, and the definition of  
143 attribute groups. The Send-Notifications operation uses the Operation Attributes group, but currently has no  
144 need for the Unsupported Attributes, Printer Object Attributes, and Job-Object Attributes groups. However,  
145 it uses a new attribute group, the Generic Attributes group.

146 ISSUE 04 - Ok to add a "Generic Attributes" group tag to [ipp-pro], instead of adding a special tag for each  
147 new object and/or operation that needs a different set of attributes than Job or Printer? The same issue for  
148 the Subscription object in [ipp-ntfy]. Either we define separate tags for both or use a single generic tag for  
149 both and future objects and attribute groups.

150 In its 1.0 version, the 'ipp-ntfy' delivery method and notification protocol is composed of a single operation,  
151 but may be extended in the future as needed (e.g., to find out specific capabilities of an 'ipp-ntfy'  
152 Notification Recipient). The operation currently defined is Send-Notifications.

### 153 4.1 Send-Notifications Operation

154 This REQUIRED operation allows a Notification Source to send one or more Notifications to a Notification  
155 Recipient using HTTP. The operation has been tailored to accommodate the current definition of IPP  
156 Notification [ipp-ntfy].

157 Both Machine-Consumable and Human-Consumable notifications may be sent to a Notification Recipient  
158 through this operation.

#### 159 **4.1.1 Send-Notifications Request**

160 The following groups of attributes are part of the Send-Notifications Request:

161 Group 1: Operation Attributes

162     Natural Language and Character Set:

163         The "attributes-charset" and "attributes-natural-language" attributes ads defined in [rfc 2566]  
164         section 3.1.4.1.

165

166     Target:

167         The URI of the 'ipp-ntfy' Notification Recipient.

168 Group 2 to N: Notification Attributes

169     "human-readable-report" (text)

170         The 'ipp-ntfy' Notification Source **OPTIONALLY** supports this attribute. This attribute is a text  
171         string generated by the IPP printer or Notification Delivery Service from the contents of the IPP  
172         Notification suitable for human consumption. If the Notification Source supports this attribute, it  
173         **MUST** supply this attribute if the Subscription object contains the "notify-text-format"  
174         (mimeMediaType) attribute. The text value of this attribute **MUST** be localized in the charset  
175         identified by the "notify-charset" (charset) attribute and the natural language identified by the notify-  
176         natural-language" (naturalLanguage) attribute supplied in the associated Subscription object that  
177         generates this event Notification. The format of the text value is specified by the value of the  
178         "notify-text-format" (mimeMediaType) supplied in the associated Subscription object.

179         **ISSUE 5 - Ok to extend Notification Model to allow a single notification to have both Human**  
180         **Consumable form and Machine Consumable form when the client asks for Human Consumable**  
181         **form by supplying the "notify-text-format" attribute rather than the Human Consumable being sent**  
182         **instead or in addition to the Machine Consumable using MIME multi-part-related?**

183         All of the **REQUIRED** attributes and any of the **OPTIONAL** attributes indicated in [ipp-ntfy] for a Push  
184         event Notification, including "notify-text-format-type" (mimeMediaType), if the "human-readable-  
185         report" (text) attribute is included, so that the Notification Recipient will know the text format of the  
186         "human-readable-report" (text) attribute value.

187         These attributes communicate the same information as the notification attributes by the same name  
188         described in sections 7.4, 7.5, and 7.6 of [ipp-ntfy]. The rules that govern when each individual attribute  
189         **MUST** or **MAY** be included in this operation precisely mirror those specified in [ipp-ntfy].

#### 190 **4.1.2 Send-Notifications Response**

191     The 'ipp-ntfy' Notification Recipient returns a status code for the entire operation and one for each  
192     Notification Report in the request if the operation's status code is other than "success-ok". If the 'ipp-ntfy'  
193     notification listener receives a Notification report that it can't pair up with a subscription it knows about, it

194 can return an error status-code to indicate that events associated with that subscription should no longer be  
195 sent to it.

196 Group 1: Operation Attributes

197     Natural Language and Character Set:

198         The "attributes-charset" and "attributes-natural-language" attributes ads defined in [rfc 2566] section  
199         3.1.4.1.

200 Group 2 to N: Notification Attributes

201 "notification-report-status-code" (type2 enum)

202     Indicates whether the 'ipp-ntfy' Notification Recipient was able to consume the n-th Notification Report.

## 203 4.2 Notification Protocol URI Scheme

204 The 'ipp-ntfy' event notification delivery method uses the 'ipp-ntfy' URI scheme in the "notify-recipients"  
205 attribute in the Subscription object in order to indicate the event notification delivery method defined in this  
206 document. The remainder of the URI indicates the host and address of the Notification Recipient that is to  
207 receive the Send-Notification operation.

208 REPEAT OF ISSUE 02 - What should the scheme name be? Consider 'ipp-ntfy' a working title, until we  
209 see several schemes. The 'ipp-get' delivery method is another example. Should the scheme name somehow  
210 include "notification", i.e., 'ntfy'? How about 'ipp-ntfy-send' or 'ipp-ntfy-push' and 'ipp-ntfy-get' or 'ipp-ntfy-  
211 pull' to go with the Send-Notifications and Get-Notifications operations, respectively?

## 212 5 Encoding of the Operation Layer

213 The 'ipp-ntfy' event notification delivery method and protocol uses the same operation layer encoding  
214 model and syntax as IPP [ipp-pro] with two extensions:

### 215 5.1 New attribute tag:

216     a) A new attribute tag is defined:

217         generic-attributes-tag = %x07 ; tag of 7

### 218 5.2 New status codes:

219     b) The following status codes are defined:

#### 220 5.2.1 unknown-notification-recipient. (0xYYYY)

221 The Notification Recipient returns this status code in order to indicate that the intended Ultimate  
222 Notification Recipient is not known to the Notification Recipient.

### 223 5.2.2 unable-to-delivery-notification-report (0xZZZZ)

224 The Notification Recipient returns this status code in order to indicate that it was unable to deliver the event  
225 Notification to the intended Ultimate Notification Recipient.

### 226 5.2.3 successful-ok-but-cancel-subscription (0xFFFF)

227 The Notification Recipient indicates that it no longer wants to receive Notifications for this Subscription  
228 object. Therefore, the Subscription object is canceled. Note: this status code allows the Notification  
229 Recipient to cancel a Subscription object without having to be the owner of the Subscription object. Only  
230 the owner of the Subscription object can cancel a Subscription object using the Cancel-Subscription  
231 operation.

232

233 The encoding for the Send-Notification Request consists of:

234	-----		
235	version-number	2 byte	
236	-----		
237	operation-id	2 bytes	
238	-----		
239	request-id	4 bytes	
240	-----		
241	operation-attributes-tag	1 byte	
242	-----		
243	natural-language-attribute	u bytes	
244	-----		
245	charset-attribute	v bytes	
246	-----		
247	target-attribute	w bytes	
248	-----		
249	generic-attributes-tag	1 byte	- 1 or more
250	-----		
251	notification-attr-list	x bytes	
252	-----		
253	end-of-attributes-tag	1 byte	
254	-----		

255 Where:

256 *version-number* is made up of a major-version-number of %d1 and a minor-version-number of %d0  
257 indicating the 1.0 version of the 'ipp-ntfy' event notification delivery method and protocol.

258 *operation-id*, in the 1.0 version of the protocol, can only be 0x00003, Send-Notification.

259 *request-id* is any 4 byte number provided by the notification source and must be matched by the notification  
260 recipient in the corresponding response to a request. It assists the notification source in associating  
261 operation responses with their corresponding requests. Note that this request id is independent of the  
262 request id embedded in the notification report, which is opaque to the delivery method but assists the  
263 notification recipient order and identity missing or duplicate notification reports.

264 *operation-attribute tag, natural-language-attribute, charset-attribute, target-attribute, and end-of-*  
 265 *attributes-tag* have the same syntax and semantics as in [ipp-pro].

266 *notification-attr-list* contains a list of the attributes that make up a single notification (see section 2 above)  
 267 encoded using the syntax specified in [ipp-pro].

268 The encoding for the Send-Notification Response consists of:

269	-----		
270		version-number	2 byte
271	-----		
272		status-code	2 bytes
273	-----		
274		request-id	4 bytes
275	-----		
276		operation-attributes-tag	1 byte
277	-----		
278		natural-language-attribute	u bytes
279	-----		
280		charset-attribute	v bytes
281	-----		
282		target-attribute	w bytes
283	-----		
284		generic-attributes-tag	1 byte
285	-----		
286		ntfy-status-code	2 bytes
287	-----		
288		end-of-attributes-tag	1 byte
289	-----		

- 1 or more

## 290 6 Encoding of Transport Layer

291 HTTP/1.1 [rfc2616] is the transport layer for this protocol.

292 The operation layer has been designed with the assumption that the transport layer contains the following  
 293 information:

- 294 - the URI of the target job or printer operation.
- 295 - the total length of the data in the operation layer, either as a single length or as a sequence of  
 296 chunks each with a length.

297 It is REQUIRED that an 'ipp-ntfy' Notification Recipient implementation support HTTP over the IANA  
 298 assigned Well Known Port XXX (the 'ipp-ntfy' notification protocol default port), though a notification  
 299 recipient implementation MAY support HTTP over some other port as well.

300 Each HTTP operation MUST use the POST method where the request-URI is the object target of the  
 301 operation, and where the "Content-Type" of the message-body in each request and response MUST be

302 "application/ipp-ntfy". The message-body MUST contain the operation layer and MUST have the syntax  
303 described in section 3, "Encoding of Operation Layer". An 'ipp-ntfy' Notification Source implementation  
304 MUST adhere to the rules for a client described for HTTP1.1 [rfc2616]. An 'ipp-ntfy' Notification Recipient  
305 implementation MUST adhere the rules for an origin server described for HTTP1.1 [rfc2616].

306 An 'ipp-ntfy' Notification Source sends a response for each request that it receives. If a notification recipient  
307 detects an error, it MAY send a response before it has read the entire request. If the HTTP layer of the  
308 Notification Recipient completes processing the HTTP headers successfully, it MAY send an intermediate  
309 response, such as "100 Continue", with no notification data before sending the notification response. The  
310 'ipp-ntfy' Notification Sources MUST expect such a variety of responses from notification recipients. For  
311 further information on HTTP/1.1, consult the HTTP documents [rfc2616].

312 An 'ipp-ntfy' Notification Recipient (server) MUST support chunking for HTTP notification requests, and  
313 an 'ipp-ntfy' Notification Source (client) MUST support chunking for HTTP notification responses  
314 according to HTTP/1.1[rfc2616]. Note: this rule causes a conflict with non-compliant implementations of  
315 HTTP/1.1 that don't support chunking for POST methods, and this rule may cause a conflict with non-  
316 compliant implementations of HTTP/1.1 that don't support chunking for CGI scripts

## 317 **7 IANA Considerations**

318 IANA will be asked to register this 'ipp-ntfy' notification delivery scheme and protocol and will be asked to  
319 assign a default port.

## 320 **8 Internationalization Considerations**

321 When the client requests Human Consumable form by supplying the "notify-text-format" operation attribute  
322 (see [ipp-ntfy]), the IPP Printer (or any Notification Service that the IPP Printer might be configured to use)  
323 supplies and localizes the text value of the "human-readable-report" attribute in the Notification according  
324 to the charset and natural language requested in the notification subscription.

## 325 **9 Security Considerations**

326 The IPP Model and Semantics document [ipp-mod] discusses high level security requirements (Client  
327 Authentication, Server Authentication and Operation Privacy). Client Authentication is the mechanism by  
328 which the client proves its identity to the server in a secure manner. Server Authentication is the mechanism  
329 by which the server proves its identity to the client in a secure manner. Operation Privacy is defined as a  
330 mechanism for protecting operations from eavesdropping.

331 The Notification Recipient can cancel unwanted Subscriptions created by other parties without having to be  
332 the owner of the subscription by returning the 'successful-ok-but-cancel-subscription' status code in the  
333 Send-Notifications response returned to the Notification Source.

## 334 9.1 Security Conformance

335 Notification Sources (client) MAY support Digest Authentication [rfc2617]. If Digest Authentication is  
336 supported, then MD5 and MD5-sess MUST be supported, but the Message Integrity feature NEED NOT be  
337 supported.

338 - .

339 - .

340 Notification Recipient (server) MAY support Digest Authentication [rfc2617]. If Digest Authentication is  
341 supported, then MD5 and MD5-sess MUST be supported, but the Message Integrity feature NEED NOT be  
342 supported.

343 Notification Recipients MAY support TLS for client authentication, server authentication and operation  
344 privacy. If a notification recipient supports TLS, it MUST support the  
345 TLS\_DHE\_DSS\_WITH\_3DES\_EDE\_CBC\_SHA cipher suite as mandated by RFC 2246 [rfc2246]. All  
346 other cipher suites are OPTIONAL. Notification recipients MAY support Basic Authentication (described  
347 in HTTP/1.1 [rfc2616]) for client authentication if the channel is secure. TLS with the above mandated  
348 cipher suite can provide such a secure channel.

## 387 **12 Full Copyright Statement**

388 Copyright (C) The Internet Society (1999). All Rights Reserved.

389 This document and translations of it may be copied and furnished to others, and derivative works that  
390 comment on or otherwise explain it or assist in its implementation may be prepared, copied, published and  
391 distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and  
392 this paragraph are included on all such copies and derivative works. However, this document itself may not  
393 be modified in any way, such as by removing the copyright notice or references to the Internet Society or  
394 other Internet organizations, except as needed for the purpose of developing Internet standards in which  
395 case the procedures for copyrights defined in the Internet Standards process must be followed, or as  
396 required to translate it into languages other than English.

397 The limited permissions granted above are perpetual and will not be revoked by the Internet Society or its  
398 successors or assigns.

399 This document and the information contained herein is provided on an "AS IS" basis and THE INTERNET  
400 SOCIETY AND THE INTERNET ENGINEERING TASK FORCE DISCLAIMS ALL WARRANTIES,  
401 EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE  
402 OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED  
403 WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.
