12
13 STATUS OF THIS MEMO
14

15 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of [RFC2026].
16 Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its
17 working groups. Note that other groups may also distribute working documents as Internet-Drafts.

18
19 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or
20 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or
21 to cite them other than as "work in progress."

22
23 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

24
25 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

26
27 ABSTRACT
28

29 This document is one of a set of documents which together describe all aspects of a new Internet Printing
30 Protocol (IPP). IPP is an application level protocol that can be used for distributed printing on the Internet.
31 There are multiple parts to IPP, but the primary architectural components are the Model, the Protocol and an
32 interface to Directory Services. This document provides a statement of the requirements for notifications as
33 part of an IPP Service.
34

34 The full set of IPP documents include:

35

36 Design Goals for an Internet Printing Protocol [RFC2567]

37 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]

38 Internet Printing Protocol/1.0: Model and Semantics [RFC2566]

39 Internet Printing Protocol/1.0: Encoding and Transport [RFC2565]

40 Internet Printing Protocol/1.0: Implementer's Guide [RFC 2639]

41 Mapping between LPD and IPP Protocols [RFC2569]

42

43 The 'Design Goals for an Internet Printing Protocol' document takes a broad look at distributed printing
44 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included in a
45 printing protocol for the Internet. It identifies requirements for three types of users: end users, operators, and
46 administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0. Operator and
47 administrator requirements are out of scope for version 1.0.

48

49 The 'Rationale for the Structure and Model and Protocol for the Internet Printing Protocol' document
50 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of IPP
51 specifications, and gives background and rationale for the IETF working group's major decisions.

52

53 The 'Internet Printing Protocol/1.0: Encoding and Transport' document is a formal mapping of the abstract
54 operations and attributes defined in the model document onto HTTP/1.1. It defines the encoding rules for a
55 new Internet media type called 'application/ipp'.

56

57 The 'Internet Printing Protocol/1.0: Implementer's Guide' document gives insight and advice to implementers of
58 IPP clients and IPP objects. It is intended to help them understand IPP/1.0 and some of the considerations
59 that may assist them in the design of their client and/or IPP object implementations. For example, a typical
60 order of processing requests is given, including error checking. Motivation for some of the specification
61 decisions is also included.

62

63 The 'Mapping between LPD and IPP Protocols' document gives some advice to implementers of gateways
64 between IPP and LPD (Line Printer Daemon) implementations.

78
79

79 **1 Scope**

80

81 The scope of this requirements document covers functionality used by the following kinds of IPP Users: End
82 Users, Print Administrators and Operators.

83

84 **2 Terminology**

85

86 It is necessary to define a set of terms in order to be able to clearly express the requirements for notification
87 services in an IPP System.

88

89 2.1 Job Submitting End User

90

91 A human end user who submits a print job to an IPP Printer. This person may or may not be within the same
92 security domain as the Printer. This person may or may not be geographically near the printer.

93

94 2.2 Administrator

95

96 A human user who established policy for and configures the print system.

97

98 2.3 Operator

99

.00 A human user who carries out the policy established by the Administrator and controls the day to day running
.01 of the print system.

.02

.03 2.4 Job Submitting Application

.04

.05 An application (for example, a batch application), acting on behalf of a Job Submitting End User, which
.06 submits a print job to an IPP Printer. The application may or may not be within the same security domain as
.07 the Printer. This application may or may not be geographically near the printer.

.08

.09 2.5 Security Domain

.10

.11 For the purposes of this discussion, the set of network components which can communicate without going
.12 through a proxy or firewall. A security domain may be geographically very large, for example - anyplace within
.13 IBM.COM.

.14

.15 2.6 IPP Client

.16

.17 The software component that sends IPP requests to an IPP Printer object and accepts IPP responses from an
.18 IPP Printer.

.19

.20 2.7 Job Recipient

.21

22 A human who is the ultimate consumer of the print job. In many cases this will be the same person as the Job
23 Submitting End User, but this need not always be the case. For example, if I use IPP to print a document on a
24 printer in a business partner's office, I am the Job Submitting End User, while the person I intend the document
25 for in my business partner's office is the Job Recipient. Since one of the goals of IPP is to be able to print near
26 the Job Recipient of the printed output, we would normally expect that person to be in the same security
27 domain as, and geographically near, the Printer. However, this may not always be the case. For example, I
28 submit a print job across the Internet to a Kinko's print shop. I am both the Submitting end User and the Job
29 Recipient, but I am neither near nor in the same security domain as the Printer.

31 2.8 Job Recipient Proxy

32
33 A person acting on behalf of the Job Recipient. In particular, the Job Recipient Proxy physically picks up the
34 printed document from the Printer, if the Job Recipient cannot perform that function. The Proxy is **by**
35 **definition** geographically near and in the same security domain as the printer. For example, I submit a print
36 job from home to be printed on a printer at work. I'd like my secretary to pick up the print job and put it on
37 my desk. In this case, I am acting as both Job Submitting End User and Job Recipient. My secretary is acting
38 as a Job Recipient Proxy.

40 2.9 Notification Subscriber

41
42 A client that requests the IPP Printer to send Event Notifications to one or more Notification Recipients. A
43 Notification Subscriber may be a Job Submitting End User or an End User, an Operator, or an Administrator
44 that is not submitting a job.

46 2.10 Notification Source

47
48 The entity that sends Event Notifications.

50 2.11 Notification Recipient

51
52 The entity that receives IPP Notifications about Job and/or Printer events. A Notification Recipient may be a:
53 Job Submitting End User, Job Submitting Application, Job Recipient, Job Recipient Proxy, Operator, or
54 Administrator, etc., and their representatives or log file or usage statistics gathering application or other active
55 or passive entities.

57 2.12 Notification Recipient Agent

58
59 A program which receives Event Notifications on behalf of the Notification Recipient. The agent may take
60 some action on behalf of the recipient, forward the notification to the recipient via some alternative means (for
61 example, page the recipient), or queue the notification for later retrieval by the recipient.

63 2.13 Event

65 A Event is some occurrence (either expected or unexpected) within the printing system of a change of state,
66 condition, or configuration of a Job or Printer object.

67

68 2.14 Event Notification

69

70 When an event occurs, an Event Notification is generated that fully describes the event (what the event was,
71 where it occurred, when it occurred, etc.). Event Notifications are delivered to all the Notification Recipients
72 that are subscribed to that Event, if any. The Event Notification is delivered to the address of the Notification
73 Recipient using the notification delivery method defined in the subscription. However, an Event Notification is
74 sent ONLY if there is a corresponding subscription.

75

76 2.15 Notification Subscription

77

78 A Notification Subscription is a request by a Notification Subscriber to the IPP Printer to send Event
79 Notifications to specified Notification Recipient(s) when the event occur.

80

81 2.16 Notification Attributes

82

83 IPP Objects (for example, a print job) from which notification are being sent may have attributes associated
84 with them. A user may want to have one or more of these associated attributes returned along with a particular
85 notification. In general, these may include any attribute associated with the object emitting the notification.

86 Examples include:

87

88 number-of-intervening jobs
89 job-k-octets
90 job-k-octets processed
91 job impressions
92 job-impressions-interpreted
93 job-impressions-completed
94 impressionsCompletedCurrentCopy (job MIB)
95 sheetCompletedCopyNumber (job MIB)
96 sheetsCompletedDocumentNumber (job MIB)
97 Copies-requested
98 Copy-type
99 Output-destination
!00 Job-state-reasons
!01 Job ID
!02 Printer URI
!03 Subscription ID (for job independent subscription)

!04

!05 2.17 Notification Delivery Method (or Delivery Method for short)

!06

!07 Event Notifications are delivered using a method, such as email, TCP/IP, etc.

!08

!09 2.18 Immediate Notification

!10

!11 Notifications sent to the Notification Recipient or the Notification Recipient's agent in such a way that the
!12 notification arrives immediately , within the limits of common addressing, routing, network congestion and
!13 quality of service.

!14

!15 2.19 Store and Forward Notification

!16

!17 Notifications which are not necessarily delivered to Notification Recipients immediately, but are queued for
!18 delivery by some intermediate network application, for later retrieval. Email is an example of a store and
!19 forward notification delivery method.

!20

!21 2.20 Reliable Delivery of Notifications

!22

!23 Notifications which are delivered by a reliable delivery of packets or character stream, with acknowledgment
!24 and retry, such that delivery of the notification is guaranteed within some determinate time limits. For example,
!25 if the Notification Recipient has logged off and gone home for the day, an immediate notification cannot be
!26 guaranteed to be delivered, even when sent over a reliable transport, because there is nothing there to catch it.
!27 Guaranteed delivery requires both store and forward notification and a reliable transport.

!28

!29 2.21 Notification over Unreliable Transport

!30

!31 Notifications are delivered via the fundamental transport address and routing framework, but no
!32 acknowledgment or retry is required. Process to process communications, if involved, are unconstrained.

!33

!34

!35 2.22 Human Consumable Notification

!36

!37 Notifications which are intended to be consumed by human end users only. Email would be an example of a
!38 Human consumable notification, though it could also contain Machine Consumable Notification.

!39

!40 2.23 Machine Consumable Notification

!41

!42 Notifications which are intended for consumption by a program **only**, such as an IPP Client. Machine
!43 Consumable notifications may not contain human readable information. Do we need both human and machine?
!44 Machine readable is intended for application to application only. The Notification Recipient could process the
!45 machine readable Event Notification into human readable format.

!46

!47 2.24 Mixed Notification

!48

!49 A mixed notification contains both Human Consumable and Machine Consumable information.

!50

!51 **3 Scenarios**

!52

!53 1. I am sitting in my office and submit a print job to the printer down the hall. I am in the same security
!54 domain as the printer and of course, geographically near. I want to know immediately when my print job
!55 will be completed (or if there is a problem) because the document I am working on is urgent. I submit the
!56 print job with the following attributes:

!57

- !58 – Notification Recipient - me
- !59 – Notification Events - all
- !60 – Notification Attributes - job-state-reason
- !61 – Notification Type - immediate

!62

!63 2. I am working from home and submit a print job to the same printer as in the previous example. However,
!64 since I am not at work, I cannot physically get the print file or do anything with it. It can wait until I get to
!65 work this afternoon. However, I'd like my secretary to pick up the output and put it on my desk so it
!66 doesn't get lost or miss-filed. I'd also like a store and forward notification sent to my email so that when I
!67 get to work I can tell if there was a problem with the print job. I submit a print job with the following
!68 attributes:

!69

- !70 – Notification Recipient - my secretary
 - !71 – Notification Events - print complete
 - !72 – Notification Type - immediate
-
- !74 – Notification Recipient - me
 - !75 – Notification Events - print complete
 - !76 – Notification Attributes - impressions completed
 - !77 – Notification Type - store and forward

!78

!79 3. I am sitting in my office and submit a print job to a client at an engineering firm we work with on a daily
!80 basis. The engineering firm is in Belgium. I would like my client to know when the print job is complete, so
!81 that she can pick it up from the printer in her building. It is important that she review it right away and get
!82 her comments back to me. I submit the print job with the following attributes:

!83

- !84 – Notification Recipient - client at engineering firm
- !85 – Notification Events - print complete
- !86 – Notification Type - immediate
- !87 – Notification Language - French

!88

!89 4. I am in a hotel room and send a print job to a Kinko's store in the town I am working in, in order to get a
!90 printed report for the meeting I am attending in the morning. Since I'm going out to dinner after I get this
!91 job submitted, an immediate notification won't do me much good. However, I'd like to check in the

- morning before I drive to the Kinko's store to see if the file has been printed. An email notification is sufficient for this purpose. I submit the print job with the following attributes:
- Notification Recipient - me
 - Notification Events - print complete
 - Notification Type - store and forward
5. I am printing a large, complex print file. I want to have some immediate feedback on the progress of the print job as it prints. I submit the print job with the following attributes:
- Notification Recipient - me
 - Notification Type - immediate
 - Notification Events - all state transitions
 - Notification Attributes - impression completed
6. I am an operator and my duties is to keep the printer running. I subscribe independently from a job submission so that my subscription outlasts any particular job. I subscribe with the following attributes:
- Notification Recipient - me
 - Notification Type - immediate
 - Notification Events - all Printer state transitions
 - Notification Attributes - Printer state, printer state reasons, device powering up, device powering down.
7. I am a usage statistics gathering application. I subscribe independently from a job submission so that my subscription outlasts any particular job. My subscription may persists across power cycles. I subscribe with the following attributes:
- Notification Recipient - me
 - Notification Type - immediate
 - Notification Events - job completion
 - Notification Attributes - impression completed, sheets completed, time submitted, time started, time completed, job owner, job size in octets, etc.
8. I am a client application program that displays a list of jobs currently queued for printing on a printer. I display the "job-name", "job-state", "job-state-reasons", "page-count", and "intervening-jobs" either for the user's jobs or for all jobs. The window displaying the job list remains open for an independent amount of time, and it is desired that it represent the current state of the queue. It is desired that the application only need to perform a slow poll in order to recover from any missed notifications. So the event delivery mechanism provides the means to update the screen on all needed changes, including querying for some attributes that may not be delivered in the Notification.

9. I am a client application program that displays a list of printers. For each Printer I display the current state and configuration. The window displaying the printer list remains open for an independent amount of time, and it is desired that it represent the current state of each printer. It is desired that the application only need to perform a slow poll in order to recover from any missed notifications. So the event delivery mechanism provides the means to update the screen on all needed changes, including querying for some attributes that may not be delivered in the Notification.
10. I am an IPP Server that controls one or more devices and implements an IPP Printer object to represent each device. I want to support IPP Notification for each of the IPP Printer objects that I implement. Many of these devices do not support notification (or IPP). So I need to support the IPP Notification semantics specified for each IPP Printer object myself on behalf of each of the devices that each of the IPP Printer objects represent. When I accept IPP job creation requests, I convert the request to what the device will accept. In some cases, I must poll the devices in order to be informed of their job and device state and state changes in order to be able to send IPP Notifications to subscribed Notification Recipients.
11. I am an IPP Server that controls one or more devices and implements an IPP Printer object to represent each device. I want to support IPP Notification for each of the IPP Printer objects that I implement. These devices all support IPP, including IPP Notification. I would like the design choice for supporting IPP Notification for these IPP Printer objects that I implement either (1) by forwarding the notification to the IPP Printers that I alone control and have them send the notifications to the intended Notification Recipients without my involvement or (2) replace the notification submitted with the Job to indicate me as the Notification Recipient and I will in turn forward Notifications to the Notification Recipients requested by my clients. Most of the rest of the contents of the IPP Job that I send to the IPP Printers that I control will be the same as the IPP Job that I receive from my IPP clients.
12. I am an IPP Server that controls one or more devices and implements an IPP Printer object to represent each device. I want to support IPP Notification for each of the IPP Printer objects that I implement. These devices all support IPP, including IPP Notification. Because these IPP Printers MAY also be being controlled by other servers (using IPP or other protocols), I only want job events for the jobs that I send, but do want Printer events all the time, so that I can show proper Printer state to my clients. So I subscribe to these IPP Printers for Printer events with a long standing subscription with myself to as the Notification Recipient. When I get a Job Creation request, I decide to which IPP Printer to send the job. When I do so, I also add a job subscription for Job events with me as the Notification Recipient to the job's job subscriptions supplied by my clients (this usage is called "piggy-backing"). These IPP Printers automatically remove their job subscriptions when the job completes as for all job subscriptions so that I no longer get Job events when my jobs are completed.

4 Requirements

The following requirements are intended to be met by the IPP Notification specification (not the implementation). The resulting IPP Notification Specification document:

- 176 1. must indicate which of these requirements are REQUIRED and which are OPTIONAL for a conforming
177 implementation to support. [See \[RFC2911\] section 12.1 for the definition of these important](#)
178 [conformance terms.](#)
179
- 180 2. must be designed to that an IPP Printer can *transparently* support the IPP Notification semantics using
181 third party notification services that exist today or that may be standardized in the future.
182
- 183 3. must define means for a Job Submitting End User to specify zero or more Notification Recipients when
184 submitting a print job. A Submitter will not be able to prevent out of band subscriptions from authorized
185 persons, such as Operators.
186
- 187 4. must define means when specifying a Notification Recipient, for a Notification Subscriber to be able to
188 specify one or more notification events for that Notification Recipient, subject to administrative and
189 security policy restrictions. Any of the following constitute Job or Printer Events that a Job Submitting End
190 User can specify notifications be sent for:
- 191 • Any standard Printer MIB alert (i.e. device alerts) (critical and warning?) (state change
192 notifications)?
 - 193 • Job Received (transition from Unknown to Pending)
 - 194 • Job Started (Transition from Pending to Processing)
 - 195 • Page Complete (Page is stacked)
 - 196 • Collated Copy Complete (last sheet of collated copy is stacked)
 - 197 • Job Complete (transition from Processing or Processing-stopped to Completed)
 - 198 • Job aborted (transition from Pending, Pending-held, Processing, or Processing-stopped to
199 Aborted)
 - 100 • Job canceled (transition from Pending, Pending-held, Processing, or Processing-held to Canceled)
 - 101 • Other job state changes like 'paused', purged?
 - 102 • Device problems for which the job is destined
 - 103 • Job (interpreter) issues
- 104
- 105 5. must define how an End User or Operator subscribes for:
- 106 • Any set of Job Events for a specific job.
 - 107 • Any set of Printer Events while a specific job is not complete.
- 108
- 109 6. must define how an End User or Operator subscribes for the following without having to submit a Job:
- 110 • Any set of Printer Events for a defined period.
 - 111 • Any set of Job Events for all jobs with no control over which jobs.
- 112
- 113 7. must define how the Notification Subscriber is able to specify either immediate or store and forward
114 notification independently for each Notification Recipient. The means may be explicit, or implied by the
115 method of delivery chosen by the Job Submitting End User.
116
- 117 8. must define common delivery methods, e.g. email, must be defined.

- l18
l19 9. must define how an IPP Printer validates its ability to deliver an Event using the specified delivery scheme.
l20 If it does not support the specified scheme, or the specified scheme is invalid for some reason, then the
l21 IPP Printer accepts and performs the request anyway and responds indicating the unsupported attribute
l22 values. There is no requirement for the IPP Printer receiving the print request to validate the identity of an
l23 Notification Recipient, nor the ability of the system to deliver an event to that recipient as requested (for
l24 example, if the Notification Recipient is not at work today).
l25
- l26 10. must define a class of IPP event notification delivery methods which can flow through corporate firewalls.
l27 However, an IPP printer need not test to guarantee delivery of the notification through a firewall before
l28 accepting a print job.
- l29 11. may define means for delivering a notification to the submitting client when the delivery of an event
l30 notification to a specified Notification Recipient fails. Fall back means of subscribers determining if
l31 notifications have failed, i.e. polling, may be provided.
l32
- l33 12. must define a mechanism for localizing Human Consumable notifications by the Notification Source.
l34
- l35 13. may define a way to specify whether or not event delivery requires acknowledgement back to the
l36 Notification Source.
l37
- l38 14. There must be a mechanism defined so that job independent subscriptions do not become stale and do not
l39 require human intervention to remove stale subscriptions. However, stale must not be the inability to
l40 deliver an Event Notification , since temporary Notification delivery problems must be tolerated.
l41
- l42 15. A mechanism must be defined so that an Event Subscriber is able to add an Event Subscription to a Job
l43 after the Job has been submitted.
l44
- l45 16. A mechanism must be defined so that a client is able to cancel an Event Subscription on a job or printer
l46 after the job has been submitted.
l47
- l48 17. A mechanism must be defined so that a client can obtain the set of current Subscriptions.
l49

l50 **5 Security considerations for IPP Notifications requirements**

l51
l52 By far the biggest security concern is the abuse of notification: sending unwanted notifications to third parties
l53 (i.e., spam). The problem is made worse by notification addresses that may be redistributed to multiple
l54 parties (e.g. mailing lists). There exist scenarios where third party notification is required (see Scenario #2 and
l55 #3). The fully secure solution would require active agreement of all recipients before sending out anything.
l56 However, requirement #9 (“There is no requirement for IPP Printer receiving the print request to validate the
l57 identity of an event recipient”) argues against this. Certain systems may decide to disallow third party
l58 notifications (a traditional fax model).
l59

l60 Clients submitting notification requests to the IPP Printer has the same security issues as submitting an IPP/1.1
l61 print job request. The same mechanisms used by IPP/1.1 can therefore be used by the client notification
l62 submission. Operations that require authentication can use the HTTP authentication. Operations that require
l63 privacy can use the HTTP/TLS privacy.
l64

l65 The notification access control model should be similar to the IPP access control model. Creating a
l66 notification subscription is associated with a user. Only the creator or an operator can cancel the subscription.
l67 The system may limit the listing of items to only those items owned by the user. Some subscriptions (e.g. those
l68 that have a lifetime longer than a job) can be done only by privileged users (operators and/or administrators), if
l69 that is the authorization policy.
l70

l71 The standard security concerns (delivery to the right user, privacy of content, tamper proof content) apply to
l72 the notification delivery. IPP should use the security mechanism of the delivery method used. Some delivery
l73 mechanisms are more secure than others. Therefore, sensitive notifications should use the delivery method that
l74 has the strongest security.
l75

l76 6 Internationalization Considerations

l77

l78 The Human Consumable notification must be localized to the natural language and charset that Notification
l79 Subscriber specifies within the choice of natural languages and charsets that the IPP Printer supports.
l80

l81 The Machine Consumable notification data uses the 'application/ipp' MIME media type. It contains some
l82 attributes whose text values are required to be in the natural language and charset that the Notification
l83 Subscriber specifies within the choice of natural languages and charsets that the IPP Printer supports. See
l84 [RFC2566].
l85

l86 7 IANA Considerations

l87

l88 There will be some notification delivery methods registered with IANA for use in URLs. These will be defined
l89 in other documents.
