Internet Printing Protocol (IPP):
The ‘mailto:’ ~~Notification~~-Delivery Method for Event Notifications

Copyright (C) The Internet Society (2000). All Rights Reserved.

16 Status of this Memo

17 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of [RFC2026].
18 Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working
19 groups. Note that other groups may also distribute working documents as Internet-Drafts.

20 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or
21 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite
22 them other than as “work in progress”.

23 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

24 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

25 **Abstract**

26 The notification extension document [ipp-ntfy] defines operations that a client can perform in order to create
27 *Subscription Objects* in a Printer and carry out other operations on them. The Subscription Object specifies that
28 when one of the specified *Events* occurs, the Printer sends an asynchronous *Event Notification* to the specified
29 *Notification Recipient* via the specified *Delivery Method* (i.e., protocol).

30 The notification extension document [ipp-ntfy] specifies that each Delivery Method is defined in another document.
31 This document is one such document, and it specifies the ‘mailto’ delivery method.

32 For this Delivery Method, when an Event occurs, the Printer immediately sends an Event Notification via an email
33 message to the Notification Recipient specified in the Subscription Object. The message body of the email consists
34 of Human Consumable text ~~and~~that is not intended to be parsed by a machine.

35 The Notification Recipient receives the Event Notification in the same way as it receives any other email message.

36 The [fullbasic](#) set of IPP documents includes:

- 37 Design Goals for an Internet Printing Protocol [RFC2567]
- 38 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]
- 39 Internet Printing Protocol/1.1: Model and Semantics [ipp-mod]
- 40 Internet Printing Protocol/1.1: Encoding and Transport [ipp-pro]
- 41 Internet Printing Protocol/1.1: Implementer's Guide [ipp-iiig]
- 42 Mapping between LPD and IPP Protocols [RFC2569]
- 43 Internet Printing Protocol (IPP): IPP Event Notification Specification [ipp-ntfy]

44

45 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed printing
46 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included in a
47 printing protocol for the Internet. It identifies requirements for three types of users: end users, operators, and
48 administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0. A few OPTIONAL
49 operator operations have been added to IPP/1.1.

50 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document describes
51 IPP from a high level view, defines a roadmap for the various documents that form the suite of IPP specification
52 documents, and gives background and rationale for the IETF working group's major decisions.

53 The "Internet Printing Protocol/1.1: Model and Semantics" document describes a simplified model with abstract
54 objects, their attributes, and their operations that are independent of encoding and transport. It introduces a Printer
55 and a Job object. The Job object optionally supports multiple documents per Job. It also addresses security,
56 internationalization, and directory issues.

57 The "Internet Printing Protocol/1.1: Encoding and Transport" document is a formal mapping of the abstract
58 operations and attributes defined in the model document onto HTTP/1.1 [RFC2616]. It defines the encoding rules
59 for a new Internet MIME media type called "application/ipp". This document also defines the rules for transporting
60 over HTTP a message body whose Content-Type is "application/ipp". This document also defines a new scheme
61 named 'ipp' for identifying IPP printers and jobs.

62 The "Internet Printing Protocol/1.1: Implementer's Guide" document gives insight and advice to implementers of
63 IPP clients and IPP objects. It is intended to help them understand IPP/1.1 and some of the considerations that
64 may assist them in the design of their client and/or IPP object implementations. For example, a typical order of
65 processing requests is given, including error checking. Motivation for some of the specification decisions is also
66 included.

67 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of gateways
68 between IPP and LPD (Line Printer Daemon) implementations.

69 The "Event Notification Specification" document describes an extension to the IPP/1.0, IPP/1.1, and future
70 versions. This extension allows a client to subscribe to printing related Events. The Subscription Object specifies
71 that when one of the specified *Event* occurs, the Printer sends an asynchronous *Event Notification* to the
72 specified *Notification Recipient* via the specified *Delivery Method* (i.e., protocol). A client associates
73 Subscription Objects with a particular Job by performing the Create-Job-Subscriptions operation or by submitting
74 a Job with subscription information. A client associates Subscription Objects with the Printer by performing a

75 Create-Printer-Subscriptions operation. Four other operations are defined for Subscription Objects: Get-
76 Subscriptions-Attributes, Get-Subscriptions, Renew-Subscription, and Cancel-Subscription.

122

123

123 **1 Introduction**

124 The notification extension document [ipp-ntfy] defines operations that a client can perform in order to create
125 *Subscription Objects* in a Printer and carry out other operations on them. A Subscription Object represents a
126 Subscription abstraction. The Subscription Object specifies that when one of the specified *Events* occurs, the
127 Printer sends an asynchronous *Event Notification* to the specified *Notification Recipient* via the specified
128 *Delivery Method* (i.e., protocol).

129 The notification extension document [ipp-ntfy] specifies that each Delivery Method is defined in another document.
130 This document is one such document, and it specifies the 'mailto' delivery method.

131 For this Delivery Method, when an Event occurs, the Printer immediately sends an Event Notification via an email
132 message to the Notification Recipient specified in the Subscription Object. The message body of the email consists
133 of Human Consumable text [and that](#) is not intended to be parsed by a machine. The 'mailto' Delivery Method is a
134 'push' Delivery Method as defined in [ipp-ntfy].

135 The Notification Recipient receives the Event Notification in the same way as it receives any other email message.

136 **2 Terminology**

137 This section defines the following terms that are used throughout this document:

138 Capitalized terms, such as **MUST**, **MUST NOT**, **REQUIRED**, **SHOULD**, **SHOULD NOT**, **MAY**, **NEED**
139 **NOT**, and **OPTIONAL**, have special meaning relating to conformance to this specification. These terms are
140 defined in [ipp-mod section 13.1 on conformance terminology, most of which is taken from RFC 2119
141 [RFC2119].

142 For capitalized terms that appear in this document, see [ipp-ntfy].

143 **3 Model and Operation**

144 In a Subscription Creation Operation, when the value of the "notify-recipient-uri" attribute contains the scheme
145 "mailto", the client is requesting that the Printer use the 'mailto' Delivery Method for Event Notifications generated
146 from the new Subscription Object.

147 For this Delivery Method, the "notify-recipient-uri" attribute value **MUST** consist of a "mailto" scheme followed by
148 a colon, and then followed by an address part (e.g. 'mailto:smith@abc.com'). See section 5.2.1 for the syntax of
149 the "notify-recipient-uri" attribute value for this Delivery Method.

150 A Printer **MUST** support SMTP [RFC821], and it **MAY** support other email protocols. A Printer **MAY** use
151 additional services, such as SMTP delivery status notification [RFC1891] or S/MIME encryption [RFC2633].

152 If the client wants the Printer to send Event Notifications via the 'mailto' Delivery Method, the client **MUST** choose
153 a value for "notify-recipient-uri" attribute which conforms to the rules of section 5.2.1. To avoid denial-of-service
154 attacks, a client **SHOULD NOT** use distribution lists as the Notification Recipient.

155 When an Event occurs, the Printer MUST immediately:

- 156 1. Find all pertinent Subscription Objects P according to the rules of section 9 of [ipp-ntfy], AND
- 157 2. Find the subset M of these Subscription Objects P whose “notify-recipient-uri” attribute has a scheme
- 158 value of ‘mailto’, AND
- 159 3. For each Subscription Object in M, the Printer MUST
- 160 a) generate an email message as specified in section 5.2.2 AND
- 161 b) send the email message to the Notification Recipient specified by the address part of the “notify-
- 162 recipient-uri” attribute value (see section 5.2.1).

163 If the Printer supports only SMTP, it MUST send the email message via SMTP. If the Printer supports additional

164 email protocols, it MUST determine the protocol from the address part of the “notify-recipient-uri” attribute value

165 and then send the email message via the appropriate email protocol.

166 When a Subscribing Client is subscribing to the ‘job-progress’ event (which is a frequently occurring event), it

167 SHOULD supply the “notify-time-interval” attribute (see [ipp-ntfy]) in the Subscription Creation request with a

168 suitable value to limit the time between ‘job-progress’ Event Notifications sent by the Printer.

169 4 General Information

170 If a Printer supports this Delivery Method, the following are its characteristics.

171 **Table 1 – Information about the Delivery Method**

Document Method Conformance Requirement	Delivery Method Realization
1. What is the URL scheme name for the Delivery Method?	mailto
2. Is the Delivery Method REQUIRED ₂ , <u>RECOMMENDED</u> , or OPTIONAL for an IPP Printer to support?	RECOMMENDED
3. What transport and delivery protocols does the Printer use to deliver the Event Notification Content, i.e., what is the entire network stack?	A Printer MUST support SMTP. It MAY support other email protocols.
4. Can several Event Notifications be combined into a Compound Event Notification?	A Printer implementation MAY combine several Event Notifications into a single email message.
5. Is the Delivery Method initiated by the Notification Recipient (pull), or by the Printer (push)?	This Delivery Method is a push.

6. Is the Event Notification content Machine Consumable or Human Consumable?	Human Consumable
7. What section in this document answers the following question? For a Machine Consumable Event Notification, what is the representation and encoding of values defined in section 9.1 of [ipp-ntfy] and the conformance requirements thereof? For a Human Consumable Event Notification, what is the representation and encoding of pieces of information defined in section 9.2 of [ipp-ntfy] and the conformance requirements thereof?	Section 6
8. What are the latency and reliability of the transport and delivery protocol?	Same as the underlying SMTP (or other optional) email transport
9. What are the security aspects of the transport and delivery protocol, e.g., how it is handled in firewalls?	Same as the underlying SMTP (or other optional) email transport
10. What are the content length restrictions?	None
11. What are the additional values or pieces of information that a Printer sends in an Event Notification content and the conformance requirements thereof?	None
12. What are the additional Subscription Template and/or Subscription Description attributes and the conformance requirements thereof?	See section 5.1.1 on "notify-mailto-text-only"
13. What are the additional Printer Description attributes and the conformance requirements thereof?	None

172 5 Subscription Template Attributes

173 5.1 Additional Subscription Template Attributes

174 This Delivery Method introduces one additional Subscription Template Attribute. [\(See Table 2\).](#)

175 **[Table 2 – Additional Subscription Template Attributes](#)**

Attribute in Subscription Object	Default and Supported Printer Attributes
notify-mailto-text-only (boolean)	N/A

176 **5.1.1 notify-mailto-text-only (boolean)**

177 When the Printer generates an Event Notification from a Subscription Object, this attribute specifies whether the
178 Printer generates the Event Notification with only plain text (i.e. 'text/plain') or with Content-Types that the Printer
179 chooses.

180 The Printer **MUST** support this attribute if it supports the 'mailto' Delivery Method.

181 A client **MAY** supply this attribute. If a client does not supply this attribute, the Printer **MUST** populate this
182 attribute with the value of 'false' on the Subscription Object. There is no "notify-mailto-text-only-default" attribute.

183 If the value of this attribute is 'true' in a Subscription Object, the message body of each Event Notification that the
184 Printer generates from the Subscription Object **MUST** contain plain text only (i.e. 'text/plain' with the charset
185 specified by the "notify-charset" Subscription Object attribute).

186 If the value of this attribute is 'false' in a Subscription Object, the [Content-Type of the](#) message body of each
187 Event Notification that the Printer generates from the Subscription Object **MUST** ~~contain a 'multipart/alternative'~~.
188 [One be either 'text/plain' or 'multipart', depending on implementation. If the Content-Type is 'multipart', one](#)
189 message body of the 'multipart/alternative' **MUST** be the same as the 'text/plain' message body when this attribute
190 has the value of 'true'. Each of the other message bodies of the 'multipart/alternative' **MAY** be any Content-Type
191 (e.g. 'text/html', 'image/gif', 'audio/basic', etc.).

192 A Printer **MUST** support both values ('true' and 'false') of this attribute. There is no "notify-mailto-text-only-
193 supported" attribute.

194 **5.2 Additional Information about Subscription Template Attributes**

195 This section describes additional values for attributes defined in [ipp-ntfy].

196 **5.2.1 notify-recipient-uri (uri)**

197 This section describes the syntax of the value of this attribute for the 'mailto' Delivery Method. The syntax for
198 values of this attribute for other Delivery Method is defined in other Delivery Method Documents.

199 In order to support the 'mailto' Delivery Method, the Printer **MUST** support the following syntax for the 'mailto'
200 Delivery Method when the Printer uses SMTP. The line below use RFC 822 syntax rules and terms.

201 "mailto:" mailbox

202 Note: the above syntax allows 1 occurrence of 'mailbox'. The occurrence of 'mailbox' represents an email
203 address of a Notification Recipient.

204 For SMTP, the phrase 'address part' of the "notify-recipient-uri" attribute value refers to the 'mailbox' part of the
205 value.

206 The Printer **MAY** support other syntax for the 'address part' if it supports email protocols in addition to SMTP.

207 **5.2.2 notify-user-data (octetString(63))**

208 This attribute has a special use for the 'mailto' Delivery Method. It specifies the email address of the Subscribing
209 Client. It is primarily useful when the Notification Recipient is some person other than the Subscribing Client. Then
210 the Notification Recipient has a way to reply to the Subscribing Client.

211 If a client specifies this Delivery Method in a Subscription Creation Operation, and the specified Notification
212 Recipient is not associated with the same person as the client, the client SHOULD supply its email address as the
213 value of the "notify-user-data" attribute. If the client does not supply this attribute, the Printer MUST NOT
214 populate the Subscription Object with this attribute.

215 **6 Event Notification Content**

216 This section describes the content of an Event Notification sent via the 'mailto' Delivery Method using the SMTP
217 protocol. This document does not describe the content for other email protocols, but an implementation should use
218 this section as a model.

219 When a Printer sends an email message via SMTP, the content MUST conform to RFC 822. The following
220 sections define the content that a Printer MUST send. A Printer MAY send additional content as long as the
221 resulting content conforms to RFC 822.

222 Each subsection below specifies the syntax that pertains to the subsection. The syntax rules and syntactic terms
223 (e.g. 'date-time') in each subsection come from RFC 822, except for the section on "Content-Type" which comes
224 from RFC 1521.

225 The Event Notification content has two parts, the headers and the message body. The headers precede the
226 message body and are separated by a blank line (see [RFC 822]).

227 **6.1 Headers**

228 When a Printer sends an Event Notification via SMTP, it MUST include the following headers. RFC 822
229 RECOMMENDS that the headers be in the order that they appear below.

230 **6.1.1 'Date' header**

231 **Syntax:** "Date" ":" date-time

232 This header contains the date and time that the Event occurred.

233 The Printer MUST include a "Date" header if and only if it supports the "printer-current-time" Printer attribute.

234 **6.1.2 'From' header**

235 **Syntax:** "From" ":" mailbox

236 where

237 mailbox = addr-spec / phrase route-addr

238 This header causes a typical email reader to show the email as coming from the Printer that is sending the Event
239 Notification.

240 The Printer MUST include a "From" header whose syntax is specified above.

241 The Printer MUST use the second alternative of the syntax for 'mailbox' defined above (i.e. 'phrase route-addr').
242 The 'phrase' is the Printer's display name and it MUST be the value of the "printer-name" Printer attribute. The
243 'route-addr' MUST contain an email address (inside angle brackets) belonging to either an administrator or the
244 output-device. This email address NEED NOT be capable of receiving mail. There is no Printer attribute to hold
245 this email address, so that it cannot be configured using the IPP protocol without an implementation-defined
246 attribute extension.

247 6.1.3 'Subject' header

248 **Syntax:** "Subject" ":" *text

249 This header specifies the subject of the message and contains a short summary of the Event Notification.

250 The Printer MUST include a "Subject" header whose syntax is specified above.

251 The Printer MUST localize the '*text' using the values of the "notify-charset" and "notify-natural-language"
252 Subscription Object attributes.

253 For Printer Events, the '*text' SHOULD start with the localized word "printer:", followed by the Printer name, and
254 then followed by the localized Event name, e.g., in English: "printer: 'tiger' stopped" or in [French: 'imprimeur](#)
255 ['tigre' arrêté](#). [Danish: 'Printeren 'tiger' er standset](#)'.

256 For Job Events, the '*text' SHOULD start with the localized phrase "print job:", followed by the Job name, and
257 then followed by the localized Event name, e.g., in English: "print job: 'financials' completed".

258 The wording is implementation dependent. A Notification Recipient MUST NOT expect to be able to parse this
259 text. But an email filter might look for "printer" or "print job".

260 6.1.4 'Sender' header

261 **Syntax:** "Sender" ":" mailbox

262 This header causes a typical email reader to show the email as coming on behalf of the person associated with the
263 Subscribing Client.

264 If the Subscription Object contains the "notify-user-data" attribute, and if its value satisfies the RFC 822 syntax
265 rules for 'mailbox', the Printer MUST include a "Sender" header whose syntax is specified above. Otherwise, the
266 Printer MUST NOT include a "Sender" header.

267 For the "Sender" header, the 'mailbox' MUST be the value of the "notify-user-data" Subscription Object attribute.
268 See section 5.2.2 for details about the "notify-user-data" attribute.

269 **6.1.5 'Reply-to' header**

270 **Syntax:** "Reply-to" ":" mailbox

271 If the Notification Recipient replies to Event Notification email, this header causes a typical email reader to send
272 email to the person acting as the Subscribing Client. The rules are identical to the "Sender" header.

273 If the Subscription Object contains the "notify-user-data" attribute, and if its value satisfies the RFC 822 syntax
274 rules for "mailbox", the Printer MUST include a "Reply-to" header whose syntax is specified above. Otherwise,
275 the Printer MUST NOT include a "Reply-to" header.

276 For the "Reply-to" header, the "mailbox" MUST be the value of the "notify-user-data" Subscription Object
277 attribute. See section 5.2.2 for details about the "notify-user-data" attribute.

278 **6.1.6 'To' header**

279 **Syntax:** "To" ":" 1#mailbox

280 See [RFC 1521] for the syntax.

281 This header specifies the Notification Recipient(s).

282 The Printer MUST include a "To" header whose syntax is specified above.

283 The '1#mailbox' MUST be the '1#mailbox' part of the value of the "notify-recipient-uri" Subscription attribute, i.e.
284 the part after the "mailto:".

285 **6.1.7 'Content-type' header**

286 **Syntax:** "Content-Type" ":" type "/" subtype *((";"parameter)

287 See [RFC 1521] for the syntactic terms (e.g. 'type').

288 This header specifies the format of the message body.

289 The Printer MUST include the "Content-Type" header.

290 ~~If the value of the "notify-mailto-text-only" Subscription Object attribute is 'true', the 'type' MUST be "plain", the~~
291 ~~'subtype' MUST be "text" and the 'parameter' MUST be "charset=XXX" where XXX is the value of the~~
292 ~~"notify-charset" Subscription Object attribute, e.g. 'text/plain; charset=UTF-8'.~~

293 ~~If the value of the "notify-mailto-text-only" Subscription Object attribute is 'false', the 'type' MUST be "multipart",~~
294 ~~the 'subtype' MUST be "alternative" and the 'parameter' MUST include the boundary string. Each header of a~~
295 ~~body part of a multipart entity also has a Content-Type and its value of 'type', 'subtype' and 'parameter' MUST~~
296 ~~be values allowed by RFC 1521 or some registered MIME type. That is, a Printer MAY send any format it wishes~~

297 ~~in each body part of a multipart entity, e.g. 'text/html', 'image/gif', or 'audio/basic'. The "notify-mailto-text-only"~~
 298 ~~attribute determines the 'type' and 'subtype' values. The possible values are "text/plain" and "multipart" values.~~

299 **6.2 Message Body**

300 ~~The message body MUST contain Human Consumable content as plain text. It MAY also contain other types of~~
 301 ~~implementation dependent content.~~

302 ~~This document describes a message body that is plain text. The content of all other Content-Types is~~ For plain text,
 303 ~~the Content-Type of Human Consumable content MUST be 'text/plain'. For implementation dependent content,~~
 304 ~~the Content-Type of Human Consumable content MUST be 'multipart'. The Content-Type of one body part~~
 305 ~~MUST be 'text/plain' and the Content-Types of the other body parts are implementation dependent. A Printer~~
 306 ~~MUST include a plain text message even when it sends other Content-Types in a 'multipart/alternative'. See~~
 307 ~~section 6.3 for a description of plain text content.~~

308 ~~The following table shows the Content-Type of the message body for the "notify-mailto-text-only" attribute:~~

<u>"notify-mailto-text-only" attribute</u>	<u>Content-Type of Message Body</u>	<u>Message Body</u>
<u>false</u>	<u>'text/plain'</u>	<u>Human Consumable</u>
<u>true</u>	<u>'text/plain' or*</u>	<u>Human Consumable plain text</u>
	<u>'multipart'</u>	<u>Human Consumable where one body part is plain text</u>

309

310 ~~* The Content-Type depends on the implementation. A Printer MAY send 'text/plain' only or it MAY send~~
 311 ~~several body parts of various Content-Types within a message body whose Content-Type is 'multipart'.~~

312 **6.3 Plain Text Content**

313 When a Printer sends a plain text message, it MUST localize the text using the values of the "notify-charset" and
 314 "notify-natural-language" Subscription Object attributes.

315 Section 9.2 in [ipp-ntfy] specifies the information that a Delivery Method MUST specify and a Printer SHOULD
 316 send.

317 ~~This section contains the information from section 9.2 in [ipp-ntfy] and changes "Printer SHOULD send"~~
 318 ~~to "Printer MUST send".~~

319 ~~A Printer MUST~~ send the following localized information in the message body. The specific wording of this
 320 information and its layout are implementation dependent.

321 a) the Printer name (see Table 3)

- 322 b) omitted (see below).
- 323 c) for Printer Events only:
 - 324 i) the Event (see Table 4) and/or Printer state information (see Table 7)
- 325 d) for Job Events only:
 - 326 i) the job identity (see Table 5)
 - 327 ii) the Event (see Table 4) and/or Job state information (see Table 6)

328 Item b) in the above list is omitted because the Printer sends the time of the Event as an email header (see section
329 6.1.1 on the 'Date' header).

330 The subsections of this section specify the attributes that a Printer **MUST** use to obtain this information.

331 The Printer **MAY** send additional information, depending on implementation.

332 Notification Recipients **MUST NOT** expect to be able to parse the message.

333 The next three sections define the attributes in Event Notification Contents that are:

- 334 a) for all Events
- 335 b) for Job Events only
- 336 c) for Printer Events only

337 **6.3.1 Event Notification Content Common to All Events**

338 The Printer **MUST** send the following information.

339 There is a separate table for each piece of information. Each row in the table represents a source value for the
340 information and the values are listed in order of preference, with the first one being the preferred one. An
341 implementation **SHOULD** use the source value from the earliest row in each table. It **MAY** use the source value
342 from another row instead, or it **MAY** combine the source values from several rows. An implementation is free to
343 determine the best way to present this information.

344 The tables in this section and following sections contain the following columns for each piece of information:

345 a) **Source of Value:** the name of the attribute that supplies the value for the Event Notification

346 ~~b) **Sends:** if the Printer supports the value (column 1) on the Source Object (column 3) the Delivery~~
347 ~~Method **MUST** specify~~

348 ~~**MUST:** that the Printer **MUST** send the value.~~

349 ~~**SHOULD:** either that the Printer **MUST** send the value or that the value is incompatible with the~~
350 ~~Delivery Method.~~

351 ~~b) **MAY:** that the Printer **MUST, SHOULD, MAY, MUST NOT, SHOULD NOT, or NEED NOT**~~
 352 ~~send the value. The Delivery Method specifies the level of conformance for the Printer.~~

353 **MAY:** this is the only value used in the tables. It means that the Printer **OPTIONALLY** sends this
 354 value. However, the Printer **SHOULD** use at least one value from each table.

355 c) **Source Object:** the object from which the source value comes.

356 ~~In all tables of this section, all rows contain a “MAY” in order to state that the Delivery Method specifies the~~
 357 ~~conformance.~~

358 Table 3 lists the source of the information for the Printer Name. The “printer-name” is more user-friendly unless the
 359 Notification Recipient is in a place where the Printer name is not meaningful. For example, an implementation could
 360 have the intelligence to send the value of the “printer-name” attribute to a Notification Recipient that can access the
 361 Printer via value of the “printer-name” attribute and otherwise send the value of the “notify-printer-uri” attribute.

362 **Table 3 – Printer Name in Event Notification Content**

Source Value	Sends	Source Object
printer-name (name(127))	MAY	Printer
notify-printer-uri (uri)	MAY	Subscription

363

364 Table 4 lists the source of the information for the Event name. A Printer MAY combine this information with state
 365 information described for Jobs in Table 6 or for Printers in Table 7.

366 **Table 4 – Event Name in Event Notification Content**

Source Value	Sends	Source Object
notify-subscribed-event (type2 keyword)	MAY	Subscription

367

368 **6.3.2 Additional Event Notification Content for Job Events**

369 This section lists the source of the additional information that a Printer **MUST** send for Job Events.

370 Table 5 lists the source of the information for the job name. The “job-name” is likely more meaningful to a user than
 371 “job-id”.

Table 5 – Job Name in Event Notification Content

Source Value	Sends	Source Object
job-name (name(MAX))	MAY	Job
job-id (integer(1:MAX))	MAY	Job

Table 6 lists the source of the information for the job-state. If a Printer supports the “job-state-message” and “job-detailed-state-message” attributes, it SHOULD use those attributes for the job state information, otherwise, it should fabricate such information from the “job-state” and “job-state-reasons”. For some Events, a Printer MAY combine this information with Event information.

Table 6 – Job State in Event Notification Content

Source Value	Sends	Source Object
job-state-message (text(MAX))	MAY	Job
job-detailed-status-messages (1setOf text(MAX))	MAY	Job
job-state (type1 enum)	MAY	Job
job-state-reasons (1setOf type2 keyword)	MAY	Job

6.3.3 Additional Event Notification Content for Printer Events

This section lists the source of the additional information that a Printer MUST send for Printer Events.

Table 7 lists the source of the information for the printer-state. If a Printer supports the “printer-state-message”, it SHOULD use that attribute for the job state information, otherwise it SHOULD fabricate such information from the “printer-state” and “printer-state-reasons”. For some Events, a Printer MAY combine this information with Event information.

Table 7 – Printer State in Event Notification Content

Source Value	Sends	Source Object
printer-state-message (text(MAX))	MAY	Printer
printer-state (type1 enum)	MAY	Printer
printer-state-reasons (1setOf type2 keyword)	MAY	Printer
printer-is-accepting-jobs (boolean)	MAY	Printer

6.4 Examples

This section contains three examples. One is a Job Event and the other two are Printer Events, the latter in Danish.

388 A Printer implementation NEED NOT generate Event Notification content that is identical or even similar to these
 389 examples. In fact it would be unfortunate if every implementation copied these example as is. These examples
 390 merely show some possibilities and are not necessarily the best way to convey information about an Event.

391 6.4.1 Job Event Example

392 This section contains an example of an Event Notification of a Job Event.

393 A Subscribing Client Mike Jones (who works for xyz Corp.) performs a Subscription Creation Operation as part
 394 of the Print-Job operation on Printer "ipp://tiger@abc.com". Mike Jones specifies that the "job-name" is
 395 "financials". Mike is printing the Job for Bill Smith at abc Corp. The Subscription Object then has the following
 396 attributes:

Attribute Name	Attribute Value
notify-recipient-uri	mailto:bsmith@abc.com
notify-events	job-completed
notify-user-data	mjones@xyz.com
notify-mailto-text-only	true
notify-charset	us-ascii
notify-natural-language	en-us
notify-subscription-id	35692
notify-sequence-number	0
notify-printer-up-time	34593
notify-printer-uri	ipp://tiger@abc.com
notify-job-id	345
notify-subscriber-user-name	mjones

397 When the Job completes, the Printer generates and sends the following email message:

```
398 Date: 17 Jul 00 1632 PDT
399 From: tiger <printAdmin@abc.com>
400 Subject: print job: 'financials' completed
401 Sender: mjones@xyz.com
402 Reply-to: mjones@xyz.com
403 To: bsmith@abc.com
404 Content-type: text/plain
405
406 printer: tiger
407 job: financials
408 job-state: completed
```

409 The reader should note that the phrases are not identical to IPP keywords. They have been localized to English.

410 6.4.2 Printer Event Example

411 This section contains an example of an Event Notification of a Printer Event.

412 A Subscribing Client Peter Williams, a Printer admin, performs a Create-Printer-Subscriptions operation on Printer
413 "ipp://tiger@abc.com". The Subscription Object then has the following attributes:

Attribute Name	Attribute Value
notify-recipient-uri	mailto:pwilliams@abc.com
notify-events	printer-state-changed
notify-mailto-text-only	true
notify-charset	us-ascii
notify-natural-language	en-us
notify-subscription-id	4623
notify-sequence-number	0
notify-printer-uptime	23002
notify-printer-uri	ipp://tiger@abc.com
notify-lease-expiration-time	0
notify-subscriber-user-name	pwilliams

414 When the Printer jams, the Printer generates and sends the following email message:

```
415 Date: 29 Aug 00 0832 PDT
416 From: tiger <printAdmin@abc.com>
417 Subject: printer: 'tiger' has stopped
418 To: pwilliams@abc.com
419 Content-type: text/plain
```

```
420
421 Printer tiger has stopped with a paper jam.
422
```

423 The reader should note that the phrases are not identical to IPP keywords. They have been localized to English.

424 6.4.3 Printer Event Example (localized to Danish)

425 This section contains an example of an Event Notification of a Printer Event localized to Danish.

426 A Subscribing Client Per Jensen, a Printer admin, performs a a Create-Printer-Subscriptions operation on Printer
427 "ipp://tiger@def.dk". The Subscription Object then has the following attributes:

Attribute Name	Attribute Value
notify-recipient-uri	mailto:pjensen@def.dk
notify-events	printer-state-changed

Attribute Name	Attribute Value
notify-mailto-text-only	true
notify-charset	utf-8
notify-natural-language	da
notify-subscription-id	50225
notify-sequence-number	0
notify-printer-uptime	53217
notify-printer-uri	ipp://tiger@def.dk
notify-lease-expiration-time	0
notify-subscriber-user-name	pjensen

428 When the Printer jams, the Printer generates and sends the following email message:

```
429 Date: 29 Jan 00 0832 CET
430 From: tiger <admin@def.dk>
431 Subject: Printeren 'tiger' er standset
432 To: pjensen@def.dk
433 Content-type: text/plain;charset=utf-8
434
435 Printerens navn er 'tiger'.
436 Printeren er standset.
437 Aarsagen er papir stop.
```

438 7 Conformance Requirements

439 The 'mailto' Delivery Method is RECOMMENDED for a Printer to support.

440 If the Printer supports the 'mailto' Delivery Method, the Printer MUST:

- 441 1. meet the conformance requirements defined in [ipp-ntfy].
- 442 2. support the "notify-mailto-text-only" Subscription Object attribute defined in section 5.1.1.
- 443 3. support the syntax for the "notify-recipient-uri" Subscription Object attribute defined in section 5.2.1
- 444 4. support the use for the "notify-user-data" Subscription Object attribute defined in section 5.2.2
- 445 5. support SMTP for sending Event Notifications.
- 446 6. support the 'text/plain' Content-Type for the message body.
- 447 7. support sending Event Notification via email with the content specified in section 5.2.

448 8 IANA Considerations

449 Because the 'mailto' URL scheme is already defined in a standards track document [RFC 2368] and registered
450 with IANA, this document does not require anything further of IANA.

451 9 Internationalization Considerations

452 This Delivery Method presents no internationalization considerations beyond those covered in the [ipp-ntfy]
453 document, and sections 6.1.3 and 6.2 of this document.

454 The Notification Recipient is expected to present the email as received because the Printer does all necessary
455 localization to the Event Notification contents.

456 10 Security Considerations

457 The biggest security concern is that a Subscribing Client will cause unsolicited Event Notifications to be sent to third
458 parties, potentially creating denial-of-service problems (i.e., spam). The problem is even worse if the third parties
459 are distribution lists.

460 There exist scenarios where third party notification is required (see Scenario #2 and #3 in [ipp-not-req]). The fully
461 secure solution would require active agreement of all persons before they can become Notification Recipients.
462 However, requirement #9 in [ipp-req] ("There is no requirement for IPP Printer receiving the print request to
463 validate the identity of an event recipient") argues against this. To minimize the risk, a Printer could disallow third
464 party Notification Recipients (a traditional facsimile model).

465 The Delivery Method recommends that the Subscribing Client supply his or her email address as the value of the
466 "notify-user-data" attribute in the Subscription Creation Operation when the Notification Recipient is a third party.
467 To reduce the chance of spamming or identify the spammer, a Printer could disallow third party Notification
468 Recipients if the Subscribing Client doesn't supply the "notify-user-data" attribute with a valid email address.

469 Some firewall administrators prevent mail attachments from being accepted into their organizations because of the
470 problem of the attachments containing computer viruses. The 'mailto' Delivery Method allows the Subscribing
471 Client to request that the Content-Type of a message body be 'text/plain'.
