17
18 Status of this Memo

19 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of [RFC2026]. Internet-Drafts are
20 working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may
21 also distribute working documents as Internet-Drafts.

22 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other
23 documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in
24 progress".

25 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

26 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

27 Abstract

28 This document is one of a set of documents, which together describe all aspects of a new Internet Printing Protocol (IPP). IPP is
29 an application level protocol that can be used for distributed printing using Internet tools and technologies. This document
30 defines the rules for encoding IPP operations and IPP attributes into a new Internet mime media type called "application/ipp".
31 This document also defines the rules for transporting over HTTP a message body whose Content-Type is "application/ipp". This
32 document defines a new scheme named 'ipp' for identifying IPP printers and jobs.

33 The full set of IPP documents includes:

- 34 Design Goals for an Internet Printing Protocol [RFC2567]
- 35 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]
- 36 Internet Printing Protocol/1.1: Model and Semantics [ipp-mod]
- 37 Internet Printing Protocol/1.1: Encoding and Transport (this document)
- 38 Internet Printing Protocol/1.1: Implementer's Guide [ipp-iig]
- 39 Mapping between LPD and IPP Protocols [RFC2569]

40 The document, "Design Goals for an Internet Printing Protocol", takes a broad look at distributed printing functionality, and it
41 enumerates real-life scenarios that help to clarify the features that need to be included in a printing protocol for the Internet. It
42 identifies requirements for three types of users: end users, operators, and administrators. It calls out a subset of end user
43 requirements that are satisfied in IPP/1.1. A few OPTIONAL operator operations have been added to IPP/1.1.

44 The document, "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol", describes IPP from a high
45 level view, defines a roadmap for the various documents that form the suite of IPP specification documents, and gives
46 background and rationale for the IETF working group's major decisions.

47 The document, "Internet Printing Protocol/1.1: Model and Semantics", describes a simplified model with abstract objects, their
48 attributes, and their operations that are independent of encoding and transport. It introduces a Printer and a Job object. The Job
49 object optionally supports multiple documents per Job. It also addresses security, internationalization, and directory issues.

50 The document "Internet Printing Protocol/1.1: Implementer's Guide", gives advice to implementers of IPP clients and IPP
51 objects.

52 The document "Mapping between LPD and IPP Protocols" gives some advice to implementers of gateways between IPP and
53 LPD (Line Printer Daemon) implementations.

109 1. Introduction

110 This document contains the rules for encoding IPP operations and describes two layers: the transport layer and the operation
111 layer.

112 The transport layer consists of an HTTP/1.1 request or response. RFC 2616 [RFC2616] describes HTTP/1.1. This document
113 specifies the HTTP headers that an IPP implementation supports.

114 The operation layer consists of a message body in an HTTP request or response. The document "Internet Printing Protocol/1.1:
115 Model and Semantics" [ipp-mod] defines the semantics of such a message body and the supported values. This document
116 specifies the encoding of an IPP operation. The aforementioned document [ipp-mod] is henceforth referred to as the "IPP model
117 document" or simply "model document."

118 Note: the version number of IPP (1.1) and HTTP (1.1) are not linked. They both just happen to be 1.1.

119 2. Conformance Terminology

120 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and
121 "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

122 3. Encoding of the Operation Layer

123 The operation layer is the message body part of the HTTP request or response and it MUST contain a single IPP operation
124 request or IPP operation response. Each request or response consists of a sequence of values and attribute groups. Attribute
125 groups consist of a sequence of attributes each of which is a name and value. Names and values are ultimately sequences of
126 octets.

127 The encoding consists of octets as the most primitive type. There are several types built from octets, but three important types are
128 integers, character strings and octet strings, on which most other data types are built. Every character string in this encoding
129 MUST be a sequence of characters where the characters are associated with some charset and some natural language. A character
130 string MUST be in "reading order" with the first character in the value (according to reading order) being the first character in the
131 encoding. A character string whose associated charset is US-ASCII whose associated natural language is US English is
132 henceforth called a US-ASCII-STRING. A character string whose associated charset and natural language are specified in a
133 request or response as described in the model document is henceforth called a LOCALIZED-STRING. An octet string MUST be
134 in "IPP model document order" with the first octet in the value (according to the IPP model document order) being the first octet
135 in the encoding. Every integer in this encoding MUST be encoded as a signed integer using two's-complement binary encoding
136 with big-endian format (also known as "network order" and "most significant byte first"). The number of octets for an integer
137 MUST be 1, 2 or 4, depending on usage in the protocol. Such one-octet integers, henceforth called SIGNED-BYTE, are used for
138 the version-number and tag fields. Such two-byte integers, henceforth called SIGNED-SHORT are used for the operation-id,
139 status-code and length fields. Four byte integers, henceforth called SIGNED-INTEGERS, are used for values fields and the
140 ~~sequence-number-request-id.~~

141 The following two sections present the encoding of the operation layer in two ways:

- 142 - informally through pictures and description
 - 143 - formally through Augmented Backus-Naur Form (ABNF), as specified by RFC 2234 [RFC2234]
- 144

145 An operation request or response MUST use the encoding described in these two sections.

146 **3.1 Picture of the Encoding**

147 **3.1.1 Request and Response**

148 ~~The encoding for an~~An operation request or response ~~consists of:~~is encoded as follows:

149	-----		
150		version-number	2 bytes - required
151	-----		
152		operation-id (request)	2 bytes - required
153		or	
154		status-code (response)	
155	-----		
156		request-id	4 bytes - required
157	-----		
158		xxx attributes tag	1 byte
159	-----		0 or more
160		xxx attribute sequence	n bytes
161	-----		
162	-----		
163		attribute-group	n bytes - 0 or more
164	-----		
165		end-of-attributes-tag	1 byte - required
166	-----		
167		data	q bytes - optional
168	-----		

169 The ~~xxx attributes tag and xxx attribute sequence~~ represents four different values of "xxx", namely, operation, job, printer and
170 unsupported. The ~~xxx attributes tag and an xxx attribute sequence~~ represent attribute groups in the model document. The ~~xxx~~
171 ~~attributes tag~~ identifies the attribute group and the ~~xxx attribute sequence~~ contains the attributes. first three fields in the above
172 diagram contain the value of attributes described in section 3.1.1 of the Model document.

173 The ~~expected sequence of xxx attributes tag and xxx attribute sequence~~ is specified in the IPP model document fourth field is the
174 "attribute-group" field, and it occurs 0 or more times. Each "attribute-group" field represents a single group of attributes, such as
175 an Operation Attributes group or a Job Attributes group (see the Model document). The IPP model document specifies the
176 required attribute groups and their order for each operation request and ~~operation~~ response.

177 A request or response SHOULD contain each ~~xxx attributes tag~~ defined for that request or response even if there are no attributes
178 except for the ~~unsupported attributes tag~~ which SHOULD be present only if the ~~unsupported attribute sequence~~ is non-empty. A
179 receiver of a request MUST be able to process as equivalent empty attribute groups:

- 180 a) an ~~xxx attributes tag~~ with an empty ~~xxx attribute sequence~~,
- 181 b) an expected but missing ~~xxx attributes tag~~.

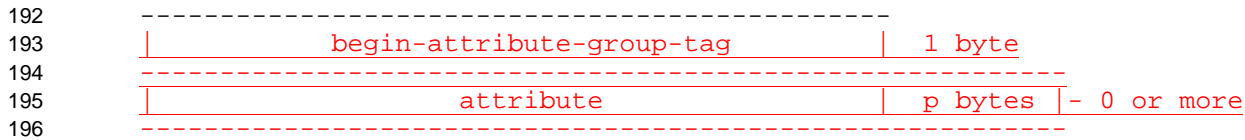

182 The data is omitted from some operations, but the end-of-attributes-tag is present even when the data is omitted. Note, the ~~xxx~~
183 ~~attributes tags~~ and end-of-attributes-tag are called 'delimiter tags'. Note: the ~~xxx attribute sequence~~, shown above may consist of
184 0 bytes, according to the rule below.

185 An ~~xxx attributes sequence~~ consists of zero or more compound attributes.

186 -----
187 | ~~compound attribute~~ | s bytes - 0 or more
188 The "end-of-attributes-tag" field is always present, even when the
189 "data" is not present. The Model document specifies for each operation request and response whether the "data" field is present
or absent.

190 3.1.2 Attribute Group

191 Each "attribute-group" field is encoded as follows:

197 A compound attribute consists of an attribute with a single value followed by zero or more additional values.

198 Note: a 'compound attribute' represents a single attribute in the model document. The 'additional value' syntax is for attributes
 199 with 2 or more values.

200 ~~Each attribute consists of:~~

201

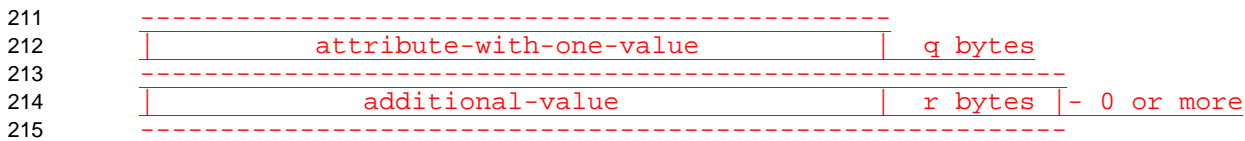

202 The "begin-attribute-group-tag" field marks the beginning of an "attribute-group" field and its value identifies the type of attribute
 203 group, e.g. Operations Attributes group versus a Job Attributes group. The "begin-attribute-group-tag" field also marks the end of
 204 the previous attribute group except for the "begin-attribute-group-tag" field in the first "attribute-group" field of a request or
 205 response. The "begin-attribute-group-tag" field acts as an "attribute-group" terminator because an "attribute-group" field cannot
 206 nest inside another "attribute-group" field.

207 An "attribute-group" field contains zero or more "attribute" fields.

208 Note, the values of the "begin-attribute-group-tag" field and the "end-of-attributes-tag" field are called "delimiter-tags".

209 3.1.3 Attribute

210 An "attribute" field is encoded as follows:

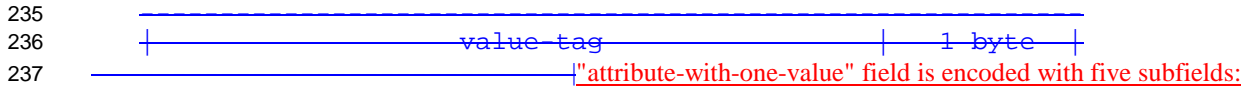

217 When an attribute is single valued (e.g. "copies" with value of 10) or multi-valued with one value (e.g. "sides-supported" with
 218 just the value 'one-sided') it is encoded with just an "attribute-with-one-value" field. When an attribute is multi-valued with n
 219 values (e.g. "sides-supported" with the values 'one-sided' and 'two-sided-long-edge'), it is encoded with an "attribute-with-one-
 220 value" field followed by n-1 "additional-value" fields.

221 3.1.4 Picture of the Encoding of an Attribute-with-one-value

222 Each "attribute-with-one-value" field is encoded as follows:

223	-----		
224		value-tag	1 byte
225	-----		
226		name-length (value is u)	2 bytes
227	-----		
228		name	u bytes
229	-----		
230		value-length (value is v)	2 bytes
231	-----		
232		value	v bytes
233	-----		

234 An ~~additional value consists of:~~

238 The "value-tag" field specifies the attribute syntax, e.g. 0x44 for the attribute syntax 'keyword'.

239 The "name-length" field specifies the length of the "name" field in bytes, e.g. u in the above diagram or 15 for the name
240 "sides-supported".

241 The "name" field contains the textual name of the attribute, e.g. "sides-supported".

242 The "value-length" field specifies the length of the "value" field in bytes, e.g. v in the above diagram or 9 for the (keyword)
243 value 'one-sided'.

244 The "value" field contains the value of the attribute, e.g. the textual value 'one-sided'.

245 **3.1.5 Additional-value**

246 Each "additional-value" field is encoded as follows:

247	-----		
248		value-tag	1 byte
249	-----		
250		name-length (value is 0x0000)	2 bytes
251	-----		0 or more
252		value-length (value is w)	2 bytes
253	-----		
254		value	w bytes
255	-----		

256

257 ~~Note: an additional value is like an attribute whose name length is 0.~~

258 -----

259

260 An "additional-value" is encoded with four subfields:

261 The "value-tag" field specifies the attribute syntax, e.g. 0x44 for the attribute syntax 'keyword'.

262 The "name-length" field has the value of 0 in order to signify that it is an "additional-value". The value of the "name-length"
263 field distinguishes an "additional-value" field ("name-length" is 0) from an "attribute-with-one-value" field ("name-length" is
264 not 0).

265 The "value-length" field specifies the length of the "value" field in bytes, e.g. w in the above diagram or 19 for the (keyword)
266 value 'two-sided-long-edge'.

267 The "value" field contains the value of the attribute, e.g. the textual value 'two-sided-long-edge'.

268 **3.1.6 Alternative Picture of the Encoding of a Request Or a Response**

269 From the standpoint of a parsing loop, parser that performs an action based on a "tag" value, the encoding consists of:

270	-----		
271		version-number	2 bytes - required
272	-----		
273		operation-id (request)	2 bytes - required
274		or	
275		status-code (response)	
276	-----		
277		request-id	4 bytes - required
278	-----		
279		tag (delimiter-tag or value-tag)	1 byte -0 or more
280	-----		
281		empty or rest of attribute	x bytes
282	-----		
283		end-of-attributes-tag	2 bytes 1 byte - required
284	-----		
285		data	y bytes - optional
286	-----		
287			

288 The value of the tag determines whether the bytes following the tag are:

- 289 -attributes
- 290 -data

291 -the remainder of a single attribute where the tag specifies the type of the value. following show what fields the parser would
292 expect after each type of "tag":

- 293 - "begin-attribute-group-tag": expect zero or more "attribute"s
- 294 - "value-tag": expect the remainder of an "attribute-with-one-value" or an "additional-value".
- 295 - "end-of-attributes-tag": expect that "attribute"s are complete and there is optional "data"

296 **3.2 Syntax of Encoding**

297 The syntax below is ABNF [RFC2234] except 'strings of literals' MUST be case sensitive. For example 'a' means lower case 'a'
298 and not upper case 'A'. In addition, SIGNED-BYTE and SIGNED-SHORT fields are represented as '%x' values which show
299 their range of values.

```

300 ipp-message = ipp-request / ipp-response
301 ipp-request = version-number operation-id request-id
302 *(xxx attributes tag xxx attribute sequence)*attribute-group end-of-attributes-tag data
303 ipp-response = version-number status-code request-id
304 *(xxx attributes tag xxx attribute sequence)*attribute-group end-of-attributes-tag data
305 xxx attribute sequence = *compound attribute
306
307 xxx attributes tag = operation attributes tag / job attributes tag /
308 printer attributes tag / unsupported attributes tagattribute-group = begin-attribute-group-tag attribute
309

```

310
 311
 312 version-number = major-version-number minor-version-number
 313 major-version-number = SIGNED-BYTE ~~; initially %d1~~
 314 minor-version-number = SIGNED-BYTE ~~; initially %d0~~
 315
 316 operation-id = SIGNED-SHORT ; mapping from model defined below
 317 status-code = SIGNED-SHORT ; mapping from model defined below
 318 request-id = SIGNED-INTEGER ; whose value is > 0
 319
 320 ~~compound-attribute = attribute *additional-values~~ attribute = attribute-with-one-value *additional-value
 321
 322 ~~attribute-with-one-value = value-tag name-length name~~
 323 ~~value-length value~~
 324 ~~additional-values = value-tag zero-name-length value-length value~~
 325
 326 name-length = SIGNED-SHORT ; number of octets of 'name'
 327 name = LALPHA *(LALPHA / DIGIT / "-" / "_" / ".")
 328 value-length = SIGNED-SHORT ; number of octets of 'value'
 329 value = OCTET-STRING
 330
 331 data = OCTET-STRING
 332
 333 zero-name-length = %x00.00 ; name-length of 0
 334 ~~operation-attributes-tag = %x01 ; tag of 1~~
 335 ~~job-attributes-tag = %x02 ; tag of 2~~
 336 ~~printer-attributes-tag = %x04 ; tag of 4~~
 337 ~~unsupported-attributes-tag = %x05 ; tag of 5~~ value-tag = %x10-FF ; see section 3.7.2
 338 begin-attribute-group-tag = %x00-02 / %04-0F ; see section 3.7.1
 339 end-of-attributes-tag = %x03 ; tag of 3
 340 ~~value-tag = %x10-FF~~
 341 ; see section 3.7.1
 342 SIGNED-BYTE = BYTE
 343 SIGNED-SHORT = 2BYTE
 344 SIGNED-INTEGER = 4BYTE
 345 DIGIT = %x30-39 ; "0" to "9"
 346 LALPHA = %x61-7A ; "a" to "z"
 347 BYTE = %x00-FF
 348 OCTET-STRING = *BYTE
 349

350 The syntax ~~allows an xxx-attributes-tag to be present when the xxx-attribute sequence that follows is empty. The syntax is~~
 351 ~~defined this way to allow for the response of Get Jobs where no attributes are returned for some job objects. Although it is~~
 352 ~~RECOMMENDED that the sender not send an xxx-attributes-tag if there are no attributes (except in the Get Jobs response just~~
 353 ~~mentioned), the below defines additional terms that are referenced in this document. This syntax provides an alternate grouping~~
 354 ~~of the delimiter tags.~~

355 ~~receiver MUST be able to decode such syntax.~~

356 delimiter-tag = begin-attribute-group-tag / ; see section 3.7.1
 357 end-of-attributes-tag
 358 delimiter-tag = %x00-0F ; see section 3.7.1
 359
 360 begin-attribute-group-tag = %x00 / operation-attributes-tag /
 361 job-attributes-tag / printer-attributes-tag /
 362 unsupported-attributes-tag / %x06-0F
 363 operation-attributes-tag = %x01 ; tag of 1

364 job-attributes-tag = %x02 ; tag of 2
 365 printer-attributes-tag = %x04 ; tag of 4
 366 unsupported-attributes-tag = %x05 ; tag of 5
 367
 368

369 3.3 Attribute-group

370 Each "attribute-group" field MUST be encoded with the "begin-attribute-group-tag" field followed by zero or more "attribute"
 371 sub-fields.

372 The table below maps the model document group name to value of the "begin-attribute-group-tag" field:

<u>Model Document Group</u>	<u>"begin-attribute-group-tag" field values</u>
<u>Operation Attributes</u>	<u>"operations-attributes-tag"</u>
<u>Job Template Attributes</u>	<u>"job-attributes-tag"</u>
<u>Job Object Attributes</u>	<u>"job-attributes-tag"</u>
<u>Unsupported Attributes</u>	<u>"unsupported-attributes-tag"</u>
<u>Requested Attributes</u> <u>(Get-Job-Attributes)</u>	<u>"job-attributes-tag"</u>
<u>Requested Attributes</u> <u>(Get-Printer-Attributes)</u>	<u>"printer-attributes-tag"</u>
<u>Document Content</u>	<u>in a special position as described above</u>

373

374 For each operation request and response, the model document prescribes the required and optional attribute groups, along with
 375 their order. Within each attribute group, the model document prescribes the required and optional attributes, along with their
 376 order.

377 When the Model document requires an attribute group in a request or response and the attribute group contains zero attributes, a
 378 request or response SHOULD encode the attribute group with the "begin-attribute-group-tag" field followed by zero "attribute"
 379 fields. For example, if the client requests a single unsupported attribute with the Get-Printer-Attributes operation, the Printer
 380 MUST return no "attribute" fields, and it SHOULD return a "begin-attribute-group-tag" field for the Printer Attributes Group.
 381 The Unsupported Attributes group is not such an example. According to the model document, the Unsupported Attributes Group
 382 SHOULD be present only if the unsupported attributes group contains at least one attribute.

383 A receiver of a request MUST be able to process the following as equivalent empty attribute groups:

- 384 a) A "begin-attribute-group-tag" field with zero following "attribute" fields.
 385 b) An expected but missing "begin-attribute-group-tag" field.

386 When the Model document requires a sequence of an unknown number of attribute groups, each of the same type, the encoding
 387 MUST contain one "begin-attribute-group-tag" field for each attribute group even when an "attribute-group" field contains zero
 388 "attribute" sub-fields. For example, for the Get-Jobs operation may return zero attributes for some jobs and not others. The
 389 "begin-attribute-group-tag" field followed by zero "attribute" fields tells the recipient that there is a job in queue for which no
 390 information is available except that it is in the queue.

391 3.4 Required Parameters

392 Some operation elements are called parameters in the model document [ipp-mod]. They MUST be encoded in a special position
 393 and they MUST NOT appear as operation attributes. These parameters are described in the subsections below.

394 3.4.1 Version-number

395 The ~~version number~~ "version-number" field MUST consist of a major and minor version-number, each of which MUST be
396 represented by a SIGNED-BYTE. The major version-number MUST be the first byte of the encoding and the minor version-
397 number MUST be the second byte of the encoding. The protocol described in this document MUST have a major version-number
398 of 1 (0x01) and a minor ~~version-version~~ number of 1 (0x01). The ABNF for these two bytes MUST be %x01.01.

399 3.4.2 Operation-id

400 ~~Operation ids are defined as enums~~ The "operation-id" field MUST contain an operation-id value defined in the model document.
401 ~~An operation ids enum~~ The value MUST be encoded as a SIGNED-SHORT, SIGNED-SHORT and it MUST be in the third and
402 fourth bytes of the encoding of an operation request.

403 3.4.3 Status-code

404 ~~Status codes are defined as enums~~ The "status-code" field MUST contain a status-code value defined in the model document. ~~A~~
405 ~~status-code enum~~ The value MUST be encoded as a SIGNED-SHORT and it MUST be in the third and fourth bytes of the
406 encoding of an operation response.

407 The status-code is an operation attribute in the model document. In the protocol, the status-code is in a special position, outside of
408 the operation attributes.

409 If an IPP status-code is returned, then the HTTP Status-Code MUST be 200 (successful-ok). With any other HTTP Status-Code
410 value, the HTTP response MUST NOT contain an IPP message-body, and thus no IPP status-code is returned.

411 3.4.4 Request-id

412 The ~~request id allows a client to match a response with a request. This mechanism is unnecessary in HTTP, but may be useful~~
413 ~~when application/ipp entity bodies are used in another context.~~

414 ~~The request id in a response MUST be the value of the request id received in the corresponding request. A client can set the~~
415 ~~request id in each request to a unique value or a constant value, such as 1, depending on what the client does with the request id~~
416 ~~returned in the response. The value of the request id MUST be greater than zero.~~ "request-id" field MUST contain a request-id
417 value as defined in the model document. The value MUST be encoded as a SIGNED- INTEGER and it MUST be in the fifth
418 through eighth bytes of the encoding.

419 3.5 Tags

420 There are two kinds of tags:

- 421 - delimiter tags: delimit major sections of the protocol, namely attributes and data
- 422 - value tags: specify the type of each attribute value

423 3.5.1 Delimiter Tags

424 The following table specifies the values for the delimiter tags:

Tag Value (Hex)	MeaningDelimiter
0x00	reserved for definition in a future IETF standards track document
0x01	"operation-attributes-tag"
0x02	"job-attributes-tag "
0x03	"end-of-attributes-tag"
0x04	"printer-attributes-tag"
0x05	"unsupported-attributes-tag"
0x06-0x0fe	reserved for future delimiters in IETF standards track documents
0x0F	reserved for future chunking end of attributes tag for definition in a future IETF standards track document

425 When ~~an xxx-attributes-tag~~ "begin-attribute-group-tag" field occurs in the protocol, it ~~MUST mean~~ means that zero or more
 426 following attributes up to the next delimiter tag ~~are~~ MUST be attributes belonging to ~~group xxx as defined in the model document,~~
 427 ~~where xxx is operation, job, printer, unsupported.~~ the attribute group specified by the value of the "begin-attribute-group-tag". For
 428 example, if the value of "begin-attribute-group-tag" is 0x01, the following attributes MUST be members of the Operations
 429 Attributes group.

430 ~~Doing substitution for xxx in the above paragraph, this means the following. When an operation-attributes-tag occurs in the~~
 431 ~~protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag are operation attributes as defined~~
 432 ~~in the model document. When an job-attributes-tag occurs in the protocol, it MUST mean that the zero or more following~~
 433 ~~attributes up to the next delimiter tag are job attributes or job template attributes as defined in the model document. When a~~
 434 ~~printer-attributes-tag occurs in the protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag~~
 435 ~~are printer attributes as defined in the model document. When an unsupported-attributes-tag occurs in the protocol, it MUST~~
 436 ~~mean that the zero or more following attributes up to the next delimiter tag are unsupported attributes as defined in the model~~
 437 ~~document.~~

438 ~~The operation-attributes-tag and end-of-attributes-tag MUST each~~ "end-of-attributes-tag" (value 0x03) MUST occur exactly once
 439 in an operation. ~~The operation-attributes-tag MUST be the first tag delimiter, and the end-of-attributes-tag~~ It ~~is~~ MUST be the last
 440 ~~tag delimiter.~~ "delimiter-tag". If the operation has a document-content group, the document data in that group MUST follow the
 441 ~~end-of-attributes-tag.~~ "end-of-attributes-tag".

442 ~~Each of the other three xxx-attributes-tags defined above is OPTIONAL in an operation and each MUST occur at most once in~~
 443 ~~an operation, except for job-attributes-tag in a Get Jobs response which may occur zero or more times.~~

444 The order and presence of ~~delimiter tags~~ "attribute-group" fields (whose beginning is marked by the "begin-attribute-group-tag"
 445 subfield) for each operation request and each operation response MUST be that defined in the model document. For further
 446 details, see section 3.7 "(Attribute) Name" and 0 "Appendix A: Protocol Examples".

447 A Printer MUST treat ~~the reserved delimiter tags~~ a "delimiter-tag" (values from 0x00 through 0x0F) differently from ~~reserved~~
 448 ~~value tags~~ "value-tag" (values from 0x10 through 0xFF) so that the Printer knows that there is an entire attribute group that it
 449 doesn't understand as opposed to a single value that it doesn't understand.

450 3.5.2 Value Tags

451 The remaining tables show values for the ~~value-tag,~~ "value-tag" field, which is the first octet of an attribute. The ~~value-tag~~ "value-
 452 tag" field specifies the type of the value of the attribute.

453 The following table specifies the "out-of-band" values for the ~~value-tag,~~ "value-tag" field.

Tag Value (Hex)	Meaning
0x10	unsupported
0x11	reserved for 'default' for definition in a future IETF standards track document
0x12	unknown
0x13	no-value
0x14-0x1F	reserved for "out-of-band" values in future IETF standards track documents.

454 ~~The "unsupported" value MUST be used in the attribute sequence of an error response for those attributes which the printer does~~
 455 ~~not support. The "default" value is reserved for future use of setting value back to their default value. The "unknown" value is~~
 456 ~~used for the value of a supported attribute when its value is temporarily unknown. The "no-value" value is used for a supported~~
 457 ~~attribute to which no value has been assigned, e.g. "job k octets supported" has no value if an implementation supports this~~
 458 ~~attribute, but an administrator has not configured the printer to have a limit.~~

459 The following table specifies the integer values for the ~~value-tag:~~value-tag field:

Tag Value (Hex)	Meaning
0x20	reserved for definition in a future IETF standards track document
0x21	integer
0x22	boolean
0x23	enum
0x24-0x2F	reserved for integer types for definition in future IETF standards track documents

460 NOTE: 0x20 is reserved for "generic integer" if it should ever be needed.

461 The following table specifies the octetString values for the ~~value-tag:~~value-tag field:

Tag Value (Hex)	Meaning
0x30	octetString with an unspecified format
0x31	dateTime
0x32	resolution
0x33	rangeOfInteger
0x34	reserved for definition in a future IETF standards track document
0x35	textWithLanguage
0x36	nameWithLanguage
0x37-0x3F	reserved for octetString type definitions in future IETF standards track documents

462 The following table specifies the character-string values for the ~~value-tag:~~value-tag field:

Tag Value (Hex)	Meaning
0x40	reserved for definition in a future IETF standards track document
0x41	textWithoutLanguage
0x42	nameWithoutLanguage
0x43	reserved for definition in a future IETF standards track document
0x44	keyword
0x45	uri
0x46	uriScheme
0x47	charset
0x48	naturalLanguage
0x49	mimeMediaType
0x4A-0x5F	reserved for character string type definitions in future IETF standards track documents

463 NOTE: 0x40 is reserved for "generic character-string" if it should ever be needed.

464 NOTE: an attribute value always has a type, which is explicitly specified by its tag; one such tag value is
465 "nameWithoutLanguage". An attribute's name has an implicit type, which is keyword.

466 The values 0x60-0xFF are reserved for future type ~~definitions~~definitions in IETF standards track documents.

467 The tag 0x7F is reserved for extending types beyond the 255 values available with a single byte. A tag value of 0x7F MUST
468 signify that the first 4 bytes of the value field are interpreted as the tag value. Note, this future extension doesn't affect parsers
469 that are unaware of this special tag. The tag is like any other unknown tag, and the value length specifies the length of a value,
470 which contains a value that the parser treats atomically. Values from 0x00 to 0x37777777 are reserved for definition in future
471 IETF standard track documents. The values 0x40000000 to 0x7FFFFFFF are reserved for vendor extensions.

472 3.6 Name-Length

473 The ~~name length~~"name-length" field MUST consist of a SIGNED-SHORT. This field MUST specify the number of octets in the
474 ~~name field which follows the name length field, excluding~~immediately following "name" field. The value of this field excludes
475 ~~the two bytes of the name length field.~~"name-length" field. For example, if the "name" field contains "sides", the value of this
476 ~~field is 5.~~field is 5.

477 If a ~~name length~~"name-length" field has a value of zero, the following ~~name~~"name" field MUST be empty, and the following
478 value MUST be treated as an additional value for the ~~preceding attribute. Within an attribute sequence,~~attribute encoded in the
479 ~~nearest preceding "attribute-with-one-value" field. Within an attribute group,~~nearest preceding "attribute-with-one-value" field. Within an attribute group,
480 ~~attribute sequence~~attribute group is mal-formed (see [ipp-mod] section 3.1.3). The zero-length name is the only mechanism for
481 multi-valued attributes.

482 3.7 (Attribute) Name

483 ~~Some operation elements are called parameters in the model document [ipp-mod]. They MUST be encoded in a special position~~
484 ~~and they MUST NOT appear as operation attributes. These parameters are:~~

- 485 ~~"version number": The parameter named "version number" in the IPP model document MUST become the "version~~
486 ~~number" field in the operation layer request or response.~~
- 487 ~~"operation id": The parameter named "operation id" in the IPP model document MUST become the "operation id" field in~~
488 ~~the operation layer request.~~
- 489 ~~"status code": The parameter named "status code" in the IPP model document MUST become the "status code" field in the~~
490 ~~operation layer response.~~

491 ~~-"request id": The parameter named "request id" in the IPP model document MUST become the "request id" field in the~~
 492 ~~operation layer request or response.~~
 493

494 ~~All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they can be persistently and~~
 495 ~~unambiguously referenced. The notion of a URI is a useful concept, however, until the notion of URI is more stable (i.e.,~~
 496 ~~defined more completely and deployed more widely), it is expected that the URIs used for IPP objects will actually be URLs~~
 497 ~~[RFC1738] [RFC1808]. Since every URL is a specialized form of a URI, even though the more generic term URI is used~~
 498 ~~throughout the rest of this document, its usage is intended to cover the more specific notion of URL as well.~~

499 ~~Some operation elements are encoded twice, once as the request URI on the HTTP Request Line and a second time as a~~
 500 ~~REQUIRED operation attribute in the application/ipp entity. These attributes are the target URI for the operation and are called~~
 501 ~~printer-uri and job-uri. Note: The target URI is included twice in an operation referencing the same IPP object, but the two URIs~~
 502 ~~NEED NOT be literally identical. One can be a relative URI and the other can be an absolute URI. HTTP/1.1 allows clients to~~
 503 ~~generate and send a relative URI rather than an absolute URI. A relative URI identifies a resource with the scope of the HTTP~~
 504 ~~server, but does not include scheme, host or port. The following statements characterize how URLs should be used in the~~
 505 ~~mapping of IPP onto HTTP/1.1:~~

- 506 ~~1. Although potentially redundant, a client MUST supply the target of the operation both as an operation attribute and as a~~
 507 ~~URI at the HTTP layer. The rationale for this decision is to maintain a consistent set of rules for mapping~~
 508 ~~application/ipp to possibly many communication layers, even where URLs are not used as the addressing mechanism in~~
 509 ~~the transport layer.~~
- 510 ~~2. Even though these two URLs might not be literally identical (one being relative and the other being absolute), they MUST~~
 511 ~~both reference the same IPP object.~~
- 512 ~~3. The URI in the HTTP layer is either relative or absolute and is used by the HTTP server to route the HTTP request to the~~
 513 ~~correct resource relative to that HTTP server. The HTTP server need not be aware of the URI within the operation~~
 514 ~~request.~~
- 515 ~~4. Once the HTTP server resource begins to process the HTTP request, it might get the reference to the appropriate IPP~~
 516 ~~Printer object from either the HTTP URI (using to the context of the HTTP server for relative URLs) or from the URI~~
 517 ~~within the operation request; the choice is up to the implementation.~~
- 518 ~~5. HTTP URIs can be relative or absolute, but the target URI in the operation MUST be an absolute URI.~~

519 ~~The "name" field MUST contain the name of an attribute.~~ The model document arranges the remaining attributes into groups for
 520 ~~each operation request and response. Each such group MUST be represented in the protocol by an xxx attribute sequence~~
 521 ~~preceded by the appropriate xxx attributes tag (See the table below and section 13 "Appendix A: Protocol Examples"). In~~
 522 ~~addition, the order of these xxx attributes tags and xxx attribute sequences in the [ipp-mod] specifies such names.~~

523 ~~protocol MUST be the same as in the model document, but the order of attributes within each xxx attribute sequence MUST be~~
 524 ~~unspecified. The table below maps the model document group name to xxx attributes sequence:~~

Model Document Group

xxx-attributes-sequence

Operation Attributes

operations-attributes-sequence

Job Template Attributes

job-attributes-sequence

Job Object Attributes

job-attributes-sequence

Unsupported Attributes

unsupported-attributes-sequence

Requested Attributes (Get Job Attributes)

job-attributes-sequence

Requested Attributes (Get Printer Attributes)

printer-attributes-sequence

Document Content

in a special position as described above

525 ~~If an operation contains attributes from more than one job object (e.g. Get Jobs response), the attributes from each job object~~
 526 ~~MUST be in a separate job attribute sequence, such that the attributes from the ith job object are in the ith job attribute sequence.~~
 527 ~~See Section 13 "Appendix A: Protocol Examples" for table showing the application of the rules above.~~

528 3.8 Value Length

529 ~~Each attribute value MUST be preceded by a SIGNED SHORT, which~~The "value-length" field MUST consist of a SIGNED-
530 ~~SHORT. This field~~ MUST specify the number of octets in the value which follows this length, exclusive of the two bytes
531 ~~specifying the length—immediately following "value" field. The value of this field excludes the two bytes of the "value-length"~~
532 ~~field. For example, if the "value" field contains the keyword (text) value 'one-sided', the value of this field is 9.~~

533 For any of the types represented by binary signed integers, the sender MUST encode the value in exactly four octets.

534 For any of the types represented by character-strings, the sender MUST encode the value with all the characters of the string and
535 without any padding characters.

536 ~~If a value tag contains an~~For "out-of-band" value "value-tag"s defined in this document, such as "unsupported", the value-
537 ~~length "value-length" MUST be 0 and the value "value" empty; the value "value" has no meaning when the value tag "value-tag"~~
538 ~~has one of these "out-of-band" values. However, the definitions of additional "out-of-band" values in future documents are able to~~
539 ~~explicitly use the value field and have a value length that is non-zero, if~~For future "out-of-band" "value-tag"s, the same rule
540 ~~holds unless the definition explicitly states that the "value-length" MAY be non-zero and the "value" non-empty~~

541 ~~there is a need for additional information to be associated with the out-of-band value. Unless the definition of an "out-of-band"~~
542 ~~value explicitly allows for a value, the value length MUST be 0 and the value empty.~~

543

544 3.9 (Attribute) Value

545 The syntax types (~~specified by the "value-tag" field~~) and most of the details of the representation of attribute values are defined in
546 the IPP model document. The table below augments the information in the model document, and defines the syntax types from
547 the model document in terms of the 5 basic types defined in section 3 "Encoding of the Operation Layer". The 5 types are US-
548 ASCII-US-ASCII-STRING, LOCALIZED-STRING, SIGNED-INTEGER, SIGNED-SHORT, SIGNED-BYTE, and OCTET-
549 STRING.

Syntax of Attribute Value**Encoding**

textWithoutLanguage,
nameWithoutLanguage

LOCALIZED-STRING.

textWithLanguage

OCTET_STRING consisting of 4 fields:

- a. a SIGNED-SHORT which is the number of octets in the following field
- b. a value of type natural-language,
- c. a SIGNED-SHORT which is the number of octets in the following field,
- d. a value of type textWithoutLanguage.

The length of a textWithLanguage value MUST be 4 + the value of field a + the value of field c.

nameWithLanguage

OCTET_STRING consisting of 4 fields:

- a. a SIGNED-SHORT which is the number of octets in the following field
- b. a value of type natural-language,
- c. a SIGNED-SHORT which is the number of octets in the following field
- d. a value of type nameWithoutLanguage.

The length of a nameWithLanguage value MUST be 4 + the value of field a + the value of field c.

charset, naturalLanguage,
mimeMediaType, keyword, uri, and
uriScheme

US-ASCII-STRING.

boolean

SIGNED-BYTE where 0x00 is 'false' and 0x01 is 'true'.

integer and enum

a SIGNED-INTEGER.

dateTime

OCTET-STRING consisting of eleven octets whose contents are defined by "DateAndTime" in RFC 1903 [RFC1903].

resolution

OCTET_STRING consisting of nine octets of 2 SIGNED-INTEGERS followed by a SIGNED-BYTE. The first SIGNED-INTEGER contains the value of cross feed direction resolution. The second SIGNED-INTEGER contains the value of feed direction resolution. The SIGNED-BYTE contains the units value.

rangeOfInteger

Eight octets consisting of 2 SIGNED-INTEGERS. The first SIGNED-INTEGER contains the lower bound and the second SIGNED-INTEGER contains the upper bound.

1setOf X

Encoding according to the rules for an attribute with more than 1 value. Each value X is encoded according to the rules for encoding its type.

octetString

OCTET-STRING

550 The attribute syntax type of the value ~~in the model document determines the encoding in the value and the value of the value-~~
551 ~~tag-~~determines its encoding and the value of its "value-tag".

552 **3.10 Data**

553 The ~~data-part~~ "data" field MUST include any data required by the operation

554

555 4. Encoding of Transport Layer

556 HTTP/1.1 [RFC2616] is the transport layer for this protocol.

557 The operation layer has been designed with the assumption that the transport layer contains the following information:

- 558 - the URI of the target job or printer operation
 - 559 - the total length of the data in the operation layer, either as a single length or as a sequence of chunks each with a length.
- 560

561 It is REQUIRED that a printer implementation support HTTP over the IANA assigned Well Known Port 631 (the IPP default
562 port), though a printer implementation may support HTTP over some other port as well.

563 Each HTTP operation MUST use the POST method where the request-URI is the object target of the operation, and where the
564 "Content-Type" of the message-body in each request and response MUST be "application/ipp". The message-body MUST
565 contain the operation layer and MUST have the syntax described in section 3.2 "Syntax of Encoding". A client implementation
566 MUST adhere to the rules for a client described for HTTP1.1 [RFC2616]. A printer (server) implementation MUST adhere the
567 rules for an origin server described for HTTP1.1 [RFC2616].

568 An IPP server sends a response for each request that it receives. If an IPP server detects an error, it MAY send a response before
569 it has read the entire request. If the HTTP layer of the IPP server completes processing the HTTP headers successfully, it MAY
570 send an intermediate response, such as "100 Continue", with no IPP data before sending the IPP response. A client MUST
571 expect such a variety of responses from an IPP server. For further information on HTTP/1.1, consult the HTTP documents
572 [RFC2616].

573 An HTTP server MUST support chunking for IPP requests, and an IPP client MUST support chunking for IPP responses
574 according to HTTP/1.1[RFC2616]. Note: this rule causes a conflict with non-compliant implementations of HTTP/1.1 that
575 don't support chunking for POST methods, and this rule may cause a conflict with non-compliant implementations of HTTP/1.1
576 that don't support chunking for CGI scripts

577 4.1 Printer-uri and job-uri

578 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they can be persistently and
579 unambiguously referenced. The notion of a URI is a useful concept, however, until the notion of URI is more stable (i.e.,
580 defined more completely and deployed more widely), it is expected that the URIs used for IPP objects will actually be URLs
581 [RFC1738] [RFC1808]. Since every URL is a specialized form of a URI, even though the more generic term URI is used
582 throughout the rest of this document, its usage is intended to cover the more specific notion of URL as well.

583 Some operation elements are encoded twice, once as the request-URI on the HTTP Request-Line and a second time as a
584 REQUIRED operation attribute in the application/ipp entity. These attributes are the target URI for the operation and are called
585 printer-uri and job-uri. Note: The target URI is included twice in an operation referencing the same IPP object, but the two URIs
586 NEED NOT be literally identical. One can be a relative URI and the other can be an absolute URI. HTTP/1.1 allows clients to
587 generate and send a relative URI rather than an absolute URI. A relative URI identifies a resource with the scope of the HTTP
588 server, but does not include scheme, host or port. The following statements characterize how URLs should be used in the
589 mapping of IPP onto HTTP/1.1:

- 590 1. Although potentially redundant, a client MUST supply the target of the operation both as an operation attribute and as a
591 URI at the HTTP layer. The rationale for this decision is to maintain a consistent set of rules for mapping
592 application/ipp to possibly many communication layers, even where URLs are not used as the addressing mechanism in
593 the transport layer.

- 594 2. Even though these two URLs might not be literally identical (one being relative and the other being absolute), they
 595 MUST both reference the same IPP object. However, a Printer NEED NOT verify that the two URLs reference the
 596 same IPP object, and NEED NOT take any action if it determines the two URLs to be different.
- 597 3. The URI in the HTTP layer is either relative or absolute and is used by the HTTP server to route the HTTP request to
 598 the correct resource relative to that HTTP server. The HTTP server need not be aware of the URI within the operation
 599 request.
- 600 4. Once the HTTP server resource begins to process the HTTP request, it might get the reference to the appropriate IPP
 601 Printer object from either the HTTP URI (using to the context of the HTTP server for relative URLs) or from the URI
 602 within the operation request; the choice is up to the implementation.
- 603 5. HTTP URIs can be relative or absolute, but the target URI in the operation MUST be an absolute URI.

604 5. IPP URL Scheme

605 The IPP/1.1 document defines a new scheme 'ipp' as the value of a URL that identifies either an IPP printer object or an IPP job
 606 object. The IPP attributes using the 'ipp' scheme are specified below. Because the HTTP layer does not support the 'ipp' scheme,
 607 a client MUST map 'ipp' URLs to 'http' URLs, and then follows the HTTP [RFC2616][RFC2617] rules for constructing a
 608 Request-Line and HTTP headers. The mapping is simple because the 'ipp' scheme implies all of the same protocol semantics as
 609 that of the 'http' scheme [RFC2616], except that it represents a print service and the implicit (default) port number that clients use
 610 to connect to a server is port 631.

611 In the remainder of this section the term 'ipp-URL' means a URL whose scheme is 'ipp' and whose implicit (default) port is 631.
 612 The term 'http-URL' means a URL whose scheme is 'http', and the term 'https-URL' means a URL whose scheme is 'https',

613 A client and an IPP object (i.e. the server) MUST support the ipp-URL value in the following IPP attributes.

614 job attributes:

615 job-uri

616 job-printer-uri

617 printer attributes:

618 printer-uri-supported

619 operation attributes:

620 job-uri

621 printer-uri

622

623 Each of the above attributes identifies a printer or job object. The ipp-URL is intended as the value of the attributes in this list,
 624 and for no other attributes. All of these attributes have a syntax type of 'uri', but there are attributes with a syntax type of 'uri' that
 625 do not use the 'ipp' scheme, e.g. 'job-more-info'.
 626

626

627 If a printer registers its URL with a directory service, the printer MUST register an ipp-URL.

628 User interfaces are beyond the scope of this document. But if software exposes the ipp-URL values of any of the above five
 629 attributes to a human user, it is REQUIRED that the human see the ipp-URL as is.
 630

630

631 When a client sends a request, it MUST convert a target ipp-URL to a target http-URL for the HTTP layer according to the
 632 following rules:

- 633 1. change the 'ipp' scheme to 'http'
- 634 2. add an explicit port 631 if the URL does not contain an explicit port. Note: port 631 is the IANA assigned Well Known
 635 Port for the 'ipp' scheme.

636 The client MUST use the target http-URL in both the HTTP Request-Line and HTTP headers, as specified by
 637 HTTP[RFC2616][RFC2617]. However, the client MUST use the target ipp-URL for the value of the "printer-uri" or "job-uri"
 638 operation attribute within the application/ipp body of the request. The server MUST use the ipp-URL for the value of the
 639 "printer-uri", "job-uri" or "printer-uri-supported" attributes within the application/ipp body of the response.
 640

640

641 For example, when an IPP client sends a request directly (i.e. no proxy) to an ipp-URL "ipp://myhost.com/myprinter/myqueue",
642 it opens a TCP connection to port 631 (the ipp implicit port) on the host "myhost.com" and sends the following data:

643
644 POST /myprinter/myqueue HTTP/1.1
645 Host: myhost.com:631
646 Content-type: application/ipp
647 Transfer-Encoding: chunked
648 ...
649 "printer-uri" "ipp://myhost.com/myprinter/myqueue"
650 (encoded in application/ipp message body)
651 ...

652
653 As another example, when an IPP client sends the same request as above via a proxy "myproxy.com", it opens a TCP connection
654 to the proxy port 8080 on the proxy host "myproxy.com" and sends the following data:

655
656 POST http://myhost.com:631/myprinter/myqueue HTTP/1.1
657 Host: myhost.com:631
658 Content-type: application/ipp
659 Transfer-Encoding: chunked
660 ...
661 "printer-uri" "ipp://myhost.com/myprinter/myqueue"
662 (encoded in application/ipp message body)
663 ...

664
665 The proxy then connects to the IPP origin server with headers that are the same as the "no-proxy" example above.

666 6. IANA Considerations

667 This section describes the procedures for allocating encoding for the following IETF standards track extensions and vendor
668 extensions to the IPP/1.1 Encoding and Transport document:

- 669 1. attribute syntaxes - see [ipp-mod] section 6.3
 - 670 2. attribute groups - see [ipp-mod] section 6.5
 - 671 3. out-of-band attribute values - see [ipp-mod] section 6.7
- 672

673 These extensions follow the "type2" registration procedures defined in [ipp-mod] section 6. Extensions registered for use with
674 IPP/1.1 are OPTIONAL for client and IPP object conformance to the IPP/1.1 Encoding and Transport document.

675 These extension procedures are aligned with the guidelines as set forth by the IESG [IANA-CON]. The [ipp-mod] Section 11
676 describes how to propose new registrations for consideration. IANA will reject registration proposals that leave out required
677 information or do not follow the appropriate format described in [ipp-mod] Section 11. The IPP/1.1 Encoding and Transport
678 document may also be extended by an appropriate RFC that specifies any of the above extensions.

679 7. Internationalization Considerations

680 See the section on "Internationalization Considerations" in the document "Internet Printing Protocol/1.1: Model and Semantics"
681 [ipp-mod] for information on internationalization. This document adds no additional issues.

682 8. Security Considerations

683 The IPP Model and Semantics document [ipp-mod] discusses high level security requirements (Client Authentication, Server
684 Authentication and Operation Privacy). Client Authentication is the mechanism by which the client proves its identity to the
685 server in a secure manner. Server Authentication is the mechanism by which the server proves its identity to the client in a secure
686 manner. Operation Privacy is defined as a mechanism for protecting operations from eavesdropping.

687 8.1 Security Conformance Requirements

688 This section defines the security requirements for IPP clients and IPP objects.

689 8.1.1 Digest Authentication

690 IPP clients MUST support:

691 Digest Authentication [RFC2617].

692 MD5 and MD5-sess MUST be implemented and supported.

693 The Message Integrity feature NEED NOT be used.

694

695 IPP Printers SHOULD support:

696 Digest Authentication [RFC2617].

697 MD5 and MD5-sess MUST be implemented and supported.

698 The Message Integrity feature NEED NOT be used.

699

700 The reasons that IPP Printers SHOULD (rather than MUST) support Digest Authentication are:

701

702 1. While Client Authentication is important, there is a certain class of printer devices where it does not make sense.
703 Specifically, a low-end device with limited ROM space and low paper throughput may not need Client Authentication. This
704 class of device typically requires firmware designers to make trade-offs between protocols and functionality to arrive at the
705 lowest-cost solution possible. Factored into the designer's decisions is not just the size of the code, but also the testing,
706 maintenance, usefulness, and time-to-market impact for each feature delivered to the customer. Forcing such low-end
707 devices to provide security in order to claim IPP/1.1 conformance would not make business sense and could potentially stall
708 the adoption of the standard.

709

710 2. Print devices that have high-volume throughput and have available ROM space have a compelling argument to provide
711 support for Client Authentication that safeguards the device from unauthorized access. These devices are prone to a high
712 loss of consumables and paper if unauthorized access should occur.

713

714 8.1.2 Transport Layer Security (TLS)

715 IPP Printers SHOULD support Transport Layer Security (TLS) [RFC2246] for Server Authentication and Operation Privacy. IPP
716 Printers MAY also support TLS for Client Authentication. If an IPP Printer supports TLS, it MUST support the
717 TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA cipher suite as mandated by RFC 2246 [RFC2246]. All other cipher suites are
718 OPTIONAL. An IPP Printer MAY support Basic Authentication (described in HTTP/1.1 [RFC2617]) for Client Authentication
719 if the channel is secure. TLS with the above mandated cipher suite can provide such a secure channel.

720 If a IPP client supports TLS, it MUST support the TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA cipher suite as mandated by
721 RFC 2246 [RFC2246]. All other cipher suites are OPTIONAL.

722 The IPP Model and Semantics document defines two printer attributes ("uri-authentication-supported" and "uri-security-
723 supported") that the client can use to discover the security policy of a printer. That document also outlines IPP-specific security
724 considerations and should be the primary reference for security implications with regard to the IPP protocol itself. For backward
725 compatibility with IPP version 1.0, IPP clients and printers may also support SSL3 [ssl]. This is in addition to the security
726 required in this document.

727 8.2 Using IPP with TLS

728 IPP/1.1 uses the "Upgrading to TLS Within HTTP/1.1" mechanism ~~[http-tls]~~ [RFC2817]. An initial IPP request never uses TLS.
729 The client requests a secure TLS connection by using the HTTP "Upgrade" header, while the server agrees in the HTTP
730 response. The switch to TLS occurs either because the server grants the client's request to upgrade to TLS, or a server asks to
731 switch to TLS in its response. Secure communication begins with a server's response to switch to TLS.

732 9. Interoperability with IPP/1.0 Implementations

733 It is beyond the scope of this specification to mandate conformance with previous versions. IPP/1.1 was deliberately designed,
734 however, to make supporting previous versions easy. It is worth noting that, at the time of composing this specification (1999),
735 we would expect IPP/1.1 Printer implementations to:

736 understand any valid request in the format of IPP/1.0, or 1.1;

737 respond appropriately with a response containing the same "version-number" parameter value used by the client in the
738 request.

739 And we would expect IPP/1.1 clients to:

740 understand any valid response in the format of IPP/1.0, or 1.1.

741 9.1 The "version-number" Parameter

742 The following are rules regarding the "version-number" parameter (see section 3.3):

- 743 1. Clients MUST send requests containing a "version-number" parameter with a '1.1' value and SHOULD try supplying
744 alternate version numbers if they receive a 'server-error-version-not-supported' error return in a response.
- 745 2. IPP objects MUST accept requests containing a "version-number" parameter with a '1.1' value (or reject the request for
746 reasons other than 'server-error-version-not-supported').
- 747 3. It is recommended that IPP objects accept any request with the major version '1' (or reject the request for reasons other
748 than 'server-error-version-not-supported'). See [ipp-mod] "versions" sub-section.
- 749 4. In any case, security MUST NOT be compromised when a client supplies a lower "version-number" parameter in a
750 request. For example, if an IPP/1.1 conforming Printer object accepts version '1.0' requests and is configured to
751 enforce Digest Authentication, it MUST do the same for a version '1.0' request.

752 9.2 Security and URL Schemes

753 The following are rules regarding security, the "version-number" parameter, and the URL scheme supplied in target attributes and
754 responses:

- 755 1. When a client supplies a request, the "printer-uri" or "job-uri" target operation attribute MUST have the same scheme
756 as that indicated in one of the values of the "printer-uri-supported" Printer attribute.
- 757 2. When the server returns the "job-printer-uri" or "job-uri" Job Description attributes, it SHOULD return the same
758 scheme ('ipp', 'https', 'http', etc.) that the client supplied in the "printer-uri" or "job-uri" target operation attributes in the
759 Get-Job-Attributes or Get-Jobs request, rather than the scheme used when the job was created. However, when a client
760 requests job attributes using the Get-Job-Attributes or Get-Jobs operations, the jobs and job attributes that the server
761 returns depends on: (1) the security in effect when the job was created, (2) the security in effect in the query request,
762 and (3) the security policy in force.
- 763 3. It is recommended that if a server registers a non-secure ipp-URL with a directory service (see [IPP-MOD] "Generic
764 Directory Schema" Appendix), then it also register an http-URL for interoperability with IPP/1.0 clients (see section
765 9).
- 766 4. In any case, security MUST NOT be compromised when a client supplies an 'http' or other non-secure URL scheme in
767 the target "printer-uri" and "job-uri" operation attributes in a request.

821

822 **13. Appendix A: Protocol Examples**823 **13.1 Print-Job Request**

824 The following is an example of a Print-Job request with job-name, copies, and sides specified. The "ipp-attribute-fidelity"
 825 attribute is set to 'true' so that the print request will fail if the "copies" or the "sides" attribute are not supported or their values are
 826 not supported.

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0002	Print-Job	operation-id

827 **13.2 Print-Job Response (successful)**

828 Here is an example of a successful Print-Job response to the previous Print-Job request. The printer supported the "copies" and
829 "sides" attributes and their supplied values. The status code returned is 'successful-ok'.

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0000	successful-ok	status-code
0x00000001	1	request-id

0x03	end-of-attributes	end-of-attributes-tag

830

831 **13.3 Print-Job Response (failure)**

832 Here is an example of an unsuccessful Print-Job response to the previous Print-Job request. It fails because, in this case, the
 833 printer does not support the "sides" attribute and because the value '20' for the "copies" attribute is not supported. Therefore, no
 834 job is created, and neither a "job-id" nor a "job-uri" operation attribute is returned. The error code returned is 'client-error-
 835 attributes-or-values-not-supported' (0x040B).
 836

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x040B	client-error-attributes-or-values-not-supported	status-code
0x00000001	1	request-id

0x03	end-of-attributes	end-of-attributes-tag

837
 838
 839
 840 **13.4 Print-Job Response (success with attributes ignored)**

841 Here is an example of a successful Print-Job response to a Print-Job request like the previous Print-Job request, except that the
 842 value of 'ipp-attribute-fidelity' is false. The print request succeeds, even though, in this case, the printer supports neither the
 843 "sides" attribute nor the value '20' for the "copies" attribute. Therefore, a job is created, and both a "job-id" and a "job-uri"
 844 operation attribute are returned. The unsupported attributes are also returned in an Unsupported Attributes Group. The error code
 845 returned is 'successful-ok-ignored-or-substituted-attributes' (0x0001).

846

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number

848

849 **13.5 Print-URI Request**

850 The following is an example of Print-URI request with copies and job-name parameters:

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0003	Print-URI	operation-id
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag
0x0012		name-length
attributes-charset	attributes-charset	name
0x0008		value-length
us-ascii	US-ASCII	value
0x48	natural-language type	value-tag
0x001B		name-length
attributes-natural-language	attributes-natural-language	name
0x0005		value-length
en-us	en-US	value
0x45	uri type	value-tag
0x000B		name-length
printer-uri	printer-uri	name
0x0015		value-length
ipp://forest/pinetree	printer pinetree	value
0x45	uri type	value-tag
0x000C		name-length
document-uri	document-uri	name
0x0011		value-length
ftp://foo.com/foo	ftp://foo.com/foo	value
0x42	nameWithoutLanguage type	value-tag
0x0008		name-length
job-name	job-name	name
0x0006		value-length
foobar	foobar	value
0x02	start job-attributes	job-attributes-tag
0x21	integer type	value-tag
0x0006		name-length
copies	copies	name
0x0004		value-length
0x00000001	1	value
0x03	end-of-attributes	end-of-attributes-tag

851

852 **13.6 Create-Job Request**

853 The following is an example of Create-Job request with no parameters and no attributes:

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0005	Create-Job	operation-id
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag
0x0012		name-length
attributes-charset	attributes-charset	name
0x0008		value-length
us-ascii	US-ASCII	value
0x48	natural-language type	value-tag
0x001B		name-length
attributes-natural-language	attributes-natural-language	name
0x0005		value-length
en-us	en-US	value
0x45	uri type	value-tag
0x000B		name-length
printer-uri	printer-uri	name
0x0015		value-length
ipp://forest/pinetree	printer pinetree	value
0x03	end-of-attributes	end-of-attributes-tag

854

855 **13.7 Get-Jobs Request**

856 The following is an example of Get-Jobs request with parameters but no attributes:

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x000A	Get-Jobs	operation-id
0x00000123	0x123	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag
0x0012		name-length
attributes-charset	attributes-charset	name
0x0008		value-length
us-ascii	US-ASCII	value
0x48	natural-language type	value-tag
0x001B		name-length
attributes-natural-language	attributes-natural-language	name
0x0005		value-length
en-us	en-US	value
0x45	uri type	value-tag
0x000B		name-length
printer-uri	printer-uri	name
0x0015		value-length
ipp://forest/pinetree	printer pinetree	value
0x21	integer type	value-tag
0x0005		name-length
limit	limit	name
0x0004		value-length
0x00000032	50	value
0x44	keyword type	value-tag
0x0014		name-length
requested-attributes	requested-attributes	name
0x0006		value-length
job-id	job-id	value
0x44	keyword type	value-tag
0x0000	additional value	name-length
0x0008		value-length
job-name	job-name	value
0x44	keyword type	value-tag
0x0000	additional value	name-length
0x000F		value-length
document-format	document-format	value
0x03	end-of-attributes	end-of-attributes-tag

857

858 **13.8 Get-Jobs Response**859 The following is an of Get-Jobs response from previous request with 3 jobs. The Printer returns no information about the second
860 job (because of security reasons):

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0000	successful-ok	status-code
0x00000123	0x123	request-id (echoed back)
0x01	start operation-attributes	operation-attribute-tag
0x47	charset type	value-tag
0x0012		name-length
attributes-charset	attributes-charset	name
0x000A		value-length
ISO-8859-1	ISO-8859-1	value
0x48	natural-language type	value-tag
0x001B		name-length

0x0009		sub-value-length
isch guet	isch guet	name
0x03	end-of-attributes	end-of-attributes-tag

861 **14. Appendix B: Registration of MIME Media Type Information for** 862 **"application/ipp"**

863 This appendix contains the information that IANA requires for registering a MIME media type. The information following this
864 paragraph will be forwarded to IANA to register application/ipp whose contents are defined in Section 3 "Encoding of the
865 Operation Layer" in this document:

866 **MIME type name:** application

867 **MIME subtype name:** ipp

868 A Content-Type of "application/ipp" indicates an Internet Printing Protocol message body (request or response). Currently there
869 is one version: IPP/1.1, whose syntax is described in Section 3 "Encoding of the Operation Layer" of [ipp-pro], and whose
870 semantics are described in [ipp-mod].

871 **Required parameters:** none

872 **Optional parameters:** none

873 **Encoding considerations:**

874 IPP/1.1 protocol requests/responses MAY contain long lines and ALWAYS contain binary data (for example attribute value
875 lengths).

876 **Security considerations:**

877 IPP/1.1 protocol requests/responses do not introduce any security risks not already inherent in the underlying transport protocols.
878 Protocol mixed-version interworking rules in [ipp-mod] as well as protocol encoding rules in [ipp-pro] are complete and
879 unambiguous.

880 **Interoperability considerations:**

881 IPP/1.1 requests (generated by clients) and responses (generated by servers) MUST comply with all conformance requirements
882 imposed by the normative specifications [ipp-mod] and [ipp-pro]. Protocol encoding rules specified in [ipp-pro] are
883 comprehensive, so that interoperability between conforming implementations is guaranteed (although support for specific
884 optional features is not ensured). Both the "charset" and "natural-language" of all IPP/1.1 attribute values which are a
885 LOCALIZED-STRING are explicit within IPP protocol requests/responses (without recourse to any external information in
886 HTTP, SMTP, or other message transport headers).

887 **Published specifications:**

888 [ipp-mod] Isaacson, S., deBry, R., Hastings, T., Herriot, R., Powell, P., "Internet Printing Protocol/1.1: Model and Semantics"
889 [draft-ietf-ipp-model-v11-06.txt, March 1, draft-ietf-ipp-model-v11-07.txt, May 22, 2000.](#)

890 [ipp-pro] Herriot, R., Butler, S., Moore, P., Turner, R., "Internet Printing Protocol/1.1: Encoding and Transport", [draft-ietf-
891 ipp-protocol-v11-05.txt, March 1, draft-ietf-ipp-protocol-v11-06.txt, May 30, 2000.](#)

892 **Applications which use this media type:**

893 Internet Printing Protocol (IPP) print clients and print servers, communicating using HTTP/1.1 (see [IPP-PRO]), SMTP/ESMTP,
894 FTP, or other transport protocol. Messages of type "application/ipp" are self-contained and transport-independent, including
895 "charset" and "natural-language" context for any LOCALIZED-STRING value.

896 **Person & email address to contact for further information:**

897 Tom Hastings
898 Xerox Corporation
899 737 Hawaii St. ESAE-231
900 El Segundo, CA

901 Phone: 310-333-6413
902 Fax: 310-333-5514
903 Email: hastings@cp10.es.xerox.com

904 or

905 Robert Herriot
906 Xerox Corporation
907 3400 Hillview Ave., Bldg #1
908 Palo Alto, CA 94304

909 Phone: 650-813-7696
910 Fax: 650-813-6860
911 Email: robert.herriot@pahv.xerox.com

912 **Intended usage:**

913 COMMON

914 **15. Appendix C: Changes from IPP/1.0**

915 IPP/1.1 is identical to IPP/1.0 [RFC2565] with the follow changes:

- 916 1. Attributes values that identify a printer or job object use a new 'ipp' scheme. The 'http' and 'https' schemes are supported only
917 for backward compatibility. See section 5.
- 918 2. Clients MUST support of Digest Authentication, IPP Printers SHOULD support Digest Authentication. See Section 8.1.1
- 919 3. TLS is recommended for channel security. In addition, SSL3 may be supported for backward compatibility. See Section
920 8.1.2
- 921 4. It is recommended that IPP/1.1 objects accept any request with major version number '1'. See section 9.1.
- 922 5. IPP objects SHOULD return the URL scheme requested for "job-printer-uri" and "job-uri" Job Attributes, rather than the
923 URL scheme used to create the job. See section 9.2.
- 924 6. The IANA and Internationalization sections have been added. The terms "private use" and "experimental" have been
925 changed to "vendor extension". The reserved allocations for attribute group tags, attribute syntax tags, and out-of-band
926 attribute values have been clarified as to which are reserved to future IETF standards track documents and which are
927 reserved to vendor extension. Both kinds of extensions use the type2 registration procedures as defined in [ipp-mod].
- 928 7. Clarified that future "out-of-band" value definitions may use the value field if additional information is needed.

929 **16. Full Copyright Statement**

930 The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to
931 pertain to the implementation or use of the technology described in this document or the extent to which any license under such
932 rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information
933 on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-
934 11[BCP-11]. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or
935 the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or
936 users of this specification can be obtained from the IETF Secretariat.

937 The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary
938 rights which may cover technology that may be required to practice this standard. Please address the information to the IETF
939 Executive Director.
