4 5	Internet Printing Protocol/1.1: Encoding and Transport	
6	Status of this Memo	
7 8 9	This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of [RFC2026]. Internet-Drafts a working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.	
20 21 22	Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress".	
23	The list of current Internet-Drafts can be accessed at http://www.ietf.org/ietf/1id-abstracts.txt	
24	The list of Internet-Draft Shadow Directories can be accessed as http://www.ietf.org/shadow.html.

27	Abstract	
28 29 30 31 32	This document is one of a set of documents, which together describe all aspects of a new Internet Printing Protocol (IPP). IPP is an application level protocol that can be used for distributed printing using Internet tools and technologies. This document defines the rules for encoding IPP operations and IPP attributes into a new Internet mime media type called "application/ipp". This document also defines the rules for transporting over HTTP a message body whose Content-Type is "application/ipp". This document defines a new scheme named 'ipp' for identifying IPP printers and jobs. Finally, this document defines rules for supporting IPP/1.0 clients	

- 34 The full set of IPP documents includes:
- 35 Design Goals for an Internet Printing Protocol [ipp-req]
- Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [ipp-rat]
- 37 Internet Printing Protocol/1.1: Model and Semantics [ipp-mod]
- 38 Internet Printing Protocol/1.1: Encoding and Transport (this document)
- 39 Internet Printing Protocol/1.1: Implementer's Guide [ipp-iig]
- 40 Mapping between LPD and IPP Protocols [ipp-lpd]
- The document, "Design Goals for an Internet Printing Protocol", takes a broad look at distributed printing functionality, and it
- enumerates real-life scenarios that help to clarify the features that need to be included in a printing protocol for the Internet. It
- 43 identifies requirements for three types of users: end users, operators, and administrators. It calls out a subset of end user
- requirements that are satisfied in IPP/1.1. Operator and administrator requirements are out of scope for version 1.1.
- 45 The document, "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol", describes IPP from a high
- 46 level view, defines a roadmap for the various documents that form the suite of IPP specifications, and gives background and
- 47 rationale for the IETF working group's major decisions.
- 48 The document, "Internet Printing Protocol/1.1: Model and Semantics", describes a simplified model with abstract objects, their
- 49 attributes, and their operations that are independent of encoding and transport. It introduces a Printer and a Job object. The Job
- 50 object optionally supports multiple documents per Job. It also addresses security, internationalization, and directory issues.
- The document "Internet Printing Protocol/1.1: Implementer's Guide", gives advice to implementers of IPP clients and IPP
- 52 objects.
- 53 The document "Mapping between LPD and IPP Protocols" gives some advice to implementers of gateways between IPP and
- 54 LPD (Line Printer Daemon) implementations.

## 1. Introduction

- This document contains the rules for encoding IPP operations and describes two layers: the transport layer and the operation
- 95 layer.

93

- The transport layer consists of an HTTP/1.1 request or response. RFC 2068 [rfc2068] describes HTTP/1.1. This document
- 97 specifies the HTTP headers that an IPP implementation supports.
- The operation layer consists of a message body in an HTTP request or response. The document "Internet Printing Protocol/1.1:
- 99 Model and Semantics" [ipp-mod] defines the semantics of such a message body and the supported values. This document
- specifies the encoding of an IPP operation. The aforementioned document [ipp-mod] is henceforth referred to as the "IPP model
- 101 document"

105

## 2. Conformance Terminology

- The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and
- "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [rfc2119].

## 3. Encoding of the Operation Layer

- The operation layer MUST contain a single operation request or operation response. Each request or response consists of a
- sequence of values and attribute groups. Attribute groups consist of a sequence of attributes each of which is a name and value.
- Names and values are ultimately sequences of octets
- The encoding consists of octets as the most primitive type. There are several types built from octets, but three important types are
- integers, character strings and octet strings, on which most other data types are built. Every character string in this encoding
- MUST be a sequence of characters where the characters are associated with some charset and some natural language. A character
- string MUST be in "reading order" with the first character in the value (according to reading order) being the first character in
- the encoding. A character string whose associated charset is US-ASCII whose associated natural language is US English is
- henceforth called a US-ASCII-STRING. A character string whose associated charset and natural language are specified in a
- request or response as described in the model document is henceforth called a LOCALIZED-STRING. An octet string MUST be
- in "IPP model document order" with the first octet in the value (according to the IPP model document order) being the first octet
- in the encoding Every integer in this encoding MUST be encoded as a signed integer using two's-complement binary encoding
- with big-endian format (also known as "network order" and "most significant byte first"). The number of octets for an integer
- MUST be 1, 2 or 4, depending on usage in the protocol. Such one-octet integers, henceforth called SIGNED-BYTE, are used for
- the version-number and tag fields. Such two-byte integers, henceforth called SIGNED-SHORT are used for the operation-id,
- 121 status-code and length fields. Four byte integers, henceforth called SIGNED-INTEGER, are used for values fields and the
- sequence number.

126

- The following two sections present the operation layer in two ways
- informally through pictures and description
- formally through Augmented Backus-Naur Form (ABNF), as specified by RFC 2234 [rfc2234]

#### 3.1 Picture of the Encoding

The encoding for an operation request or response consists of:

146

147

153

154

155

156

157

128		_	
129	version-number	2 bytes	- required
130 131	operation-id (request)	-	
132	or	2 bytes	- required
133 134	status-code (response)	-	
135 136	request-id	4 bytes	- required
137	xxx-attributes-tag	1 byte	_
138 139 140	xxx-attribute-sequence	n bytes	-0 or more 
141	end-of-attributes-tag	1 byte	- required
142 143 144	data	q bytes	- optional

The xxx-attributes-tag and xxx-attribute-sequence represents four different values of "xxx", namely, operation, job, printer and unsupported. The xxx-attributes-tag and an xxx-attribute-sequence represent attribute groups in the model document. The xxx-attributes-tag identifies the attribute group and the xxx-attribute-sequence contains the attributes.

- The expected sequence of xxx-attributes-tag and xxx-attribute-sequence is specified in the IPP model document for each operation request and operation response.
- A request or response SHOULD contain each xxx-attributes-tag defined for that request or response even if there are no attributes except for the unsupported-attributes-tag which SHOULD be present only if the unsupported-attribute-sequence is non-empty. A receiver of a request MUST be able to process as equivalent empty attribute groups:
  - a) an xxx-attributes-tag with an empty xxx-attribute-sequence,
  - b) an expected but missing xxx-attributes-tag.
  - The data is omitted from some operations, but the end-of-attributes-tag is present even when the data is omitted. Note, the xxx-attributes-tags and end-of-attributes-tag are called 'delimiter-tags'. Note: the xxx-attribute-sequence, shown above may consist of 0 bytes, according to the rule below.
- An xxx-attributes-sequence consists of zero or more compound-attributes.

- A compound-attribute consists of an attribute with a single value followed by zero or more additional values.
- Note: a 'compound-attribute' represents a single attribute in the model document. The 'additional value' syntax is for attributes with 2 or more values.
- 165 Each attribute consists of:

```
166
167
                                            1 byte
168
169
          name-length (value is u)
                                            2 bytes
170
171
                                            u bytes
172
         value-length (value is v)
173
                                            2 bytes
174
175
                 value
                                            v bytes
176
```

An additional value consists of:

177

178

179 180

181

182

183 184

185

186 187 188

189

190

191

192 193

194

195 196

197 198

199 200

201 202

203

204 205

206207

208

209210

211

212

```
| value-tag | 1 byte |
| name-length (value is 0x0000) | 2 bytes |
| value-length (value is w) | 2 bytes |
| value | w bytes |
```

Note: an additional value is like an attribute whose name-length is 0.

From the standpoint of a parsing loop, the encoding consists of:

```
version-number
                        2 bytes - required
       operation-id (request)
                        2 bytes - required
   status-code (response)
         request-id
                        4 bytes - required
______
tag (delimiter-tag or value-tag)
|-0 or more
 empty or rest of attribute | x bytes |
______
  end-of-attributes-tag
                        2 bytes - required
_____
                        y bytes - optional
```

The value of the tag determines whether the bytes following the tag are:

- attributes
  - data
    - the remainder of a single attribute where the tag specifies the type of the value.

#### 3.2 Syntax of Encoding

The syntax below is ABNF [rfc2234] except 'strings of literals' MUST be case sensitive. For example 'a' means lower case 'a' and not upper case 'A'. In addition, SIGNED-BYTE and SIGNED-SHORT fields are represented as '%x' values which show their

215 range of values.

262

263

264 265

```
216
           ipp-message = ipp-request / ipp-response
217
           ipp-request = version-number operation-id request-id
                 *(xxx-attributes-tag xxx-attribute-sequence) end-of-attributes-tag data
218
           ipp-response = version-number status-code request-id
219
220
                 *(xxx-attributes-tag xxx-attribute-sequence) end-of-attributes-tag data
           xxx-attribute-sequence = *compound-attribute
221
222
223
           xxx-attributes-tag = operation-attributes-tag / job-attributes-tag /
224
               printer-attributes-tag / unsupported-attributes-tag
225
226
           version-number = major-version-number minor-version-number
           major-version-number = SIGNED-BYTE; initially %d1
227
           minor-version-number = SIGNED-BYTE; initially %d0
228
229
           operation-id = SIGNED-SHORT ; mapping from model defined below
230
           status-code = SIGNED-SHORT; mapping from model defined below
231
           request-id = SIGNED-INTEGER; whose value is > 0
232
233
           compound-attribute = attribute *additional-values
234
235
           attribute = value-tag name-length name value-length value
236
           additional-values = value-tag zero-name-length value-length value
237
238
239
           name-length = SIGNED-SHORT ; number of octets of 'name'
           name = LALPHA *( LALPHA / DIGIT / "-" / " ." )
240
241
           value-length = SIGNED-SHORT; number of octets of 'value'
           value = OCTET-STRING
242
243
           data = OCTET-STRING
244
245
246
           zero-name-length = \% \times 00.00
                                                             ; name-length of 0
           operation-attributes-tag = %x01
                                                             ; tag of 1
247
248
           job-attributes-tag
                                 = \% x02
                                                             ; tag of 2
           printer-attributes-tag = \% x04
                                                             ; tag of 4
249
250
           unsupported- attributes-tag = \% x05; tag of 5
251
           end-of-attributes-tag = \% x03
                                                             ; tag of 3
           value-tag = %x10-FF
252
253
           SIGNED-BYTE = BYTE
254
255
           SIGNED-SHORT = 2BYTE
           SIGNED-INTEGER = 4BYTE
256
257
           DIGIT = \% x30-39 ; "0" to "9"
           LALPHA = \% x61-7A; "a" to "z"
258
           BYTE = %x00-FF
259
260
           OCTET-STRING = *BYTE
```

The syntax allows an xxx-attributes-tag to be present when the xxx-attribute-sequence that follows is empty. The syntax is defined this way to allow for the response of Get-Jobs where no attributes are returned for some job-objects. Although it is RECOMMENDED that the sender not send an xxx-attributes-tag if there are no attributes (except in the Get-Jobs response just mentioned), the receiver MUST be able to decode such syntax.

#### 3.3 Version-number

- The version-number MUST consist of a major and minor version-number, each of which MUST be represented by a SIGNED-
- BYTE. The protocol described in this document MUST have a major version-number of 1 (0x01) and a minor version-number of
- 1 (0x01). The ABNF for these two bytes MUST be %x01.01.

#### 3.4 Operation-id

- 271 Operation-ids are defined as enums in the model document. An operation-ids enum value MUST be encoded as a SIGNED-
- 272 SHORT.

266

270

280

288

Note: the values 0x4000 to 0xFFFF are reserved for private extensions.

#### 274 3.5 Status-code

- 275 Status-codes are defined as enums in the model document. A status-code enum value MUST be encoded as a SIGNED-SHORT.
- The status-code is an operation attribute in the model document. In the protocol, the status-code is in a special position, outside of
- the operation attributes.
- 278 If an IPP status-code is returned, then the HTTP Status-Code MUST be 200 (successful-ok). With any other HTTP Status-Code
- value, the HTTP response MUST NOT contain an IPP message-body, and thus no IPP status-code is returned.

#### 3.6 Request-id

- The request-id allows a client to match a response with a request. This mechanism is unnecessary in HTTP, but may be useful
- when application/ipp entity bodies are used in another context.
- The request-id in a response MUST be the value of the request-id received in the corresponding request. A client can set the
- request-id in each request to a unique value or a constant value, such as 1, depending on what the client does with the request-id
- returned in the response. The value of the request-id MUST be greater than zero.

#### 286 **3.7 Tags**

- There are two kinds of tags:
  - delimiter tags: delimit major sections of the protocol, namely attributes and data
- value tags: specify the type of each attribute value
- 290 3.7.1 Delimiter Tags
- 291 The following table specifies the values for the delimiter tags:

Tag Value (Hex)	Delimiter
0x00	reserved
0x01	operation-attributes-tag
0x02	iob-attributes-tag

Tag Value (Hex)	Delimiter
0x03	end-of-attributes-tag
0x04	printer-attributes-tag
0x05	unsupported-attributes-tag
0x06-0x0e	reserved for future delimiters
0x0F	reserved for future chunking-end-of-attributes-tag

When an xxx-attributes-tag occurs in the protocol, it MUST mean that zero or more following attributes up to the next delimiter tag are attributes belonging to group xxx as defined in the model document, where xxx is operation, job, printer, unsupported.

Doing substitution for xxx in the above paragraph, this means the following. When an operation-attributes-tag occurs in the protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag are operation attributes as defined in the model document. When an job-attributes-tag occurs in the protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag are job attributes or job template attributes as defined in the model document. When a printer-attributes-tag occurs in the protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag are printer attributes as defined in the model document. When an unsupported-attributes-tag occurs in the protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag are unsupported attributes as defined in the model document.

- The operation-attributes-tag and end-of-attributes-tag MUST each occur exactly once in an operation. The operation-attributes-tag MUST be the first tag delimiter, and the end-of-attributes-tag MUST be the last tag delimiter. If the operation has a document-content group, the document data in that group MUST follow the end-of-attributes-tag.
- Each of the other three xxx-attributes-tags defined above is OPTIONAL in an operation and each MUST occur at most once in an operation, except for job-attributes-tag in a Get-Jobs response which may occur zero or more times.
- The order and presence of delimiter tags for each operation request and each operation response MUST be that defined in the model document. For further details, see section 3.9 "(Attribute) Name" and section 11 "Appendix A: Protocol Examples".
- A Printer MUST treat the reserved delimiter tags differently from reserved value tags so that the Printer knows that there is an entire attribute group that it doesn't understand as opposed to a single value that it doesn't understand.
- 311 3.7.2 Value Tags

294

295

296

297

298

299

300

301

The remaining tables show values for the value-tag, which is the first octet of an attribute. The value-tag specifies the type of the value of the attribute. The following table specifies the "out-of-band" values for the value-tag.

Tag Value (Hex)	Meaning
0x10	unsupported
0x11	reserved for future 'default'
0x12	unknown
0x13	no-value
0x14-0x1F	reserved for future "out-of-band" values.

- The "unsupported" value MUST be used in the attribute-sequence of an error response for those attributes which the printer does not support. The "default" value is reserved for future use of setting value back to their default value. The "unknown" value is used for the value of a supported attribute when its value is temporarily unknown. The "no-value" value is used for a supported attribute to which no value has been assigned, e.g. "job-k-octets-supported" has no value if an implementation supports this attribute, but an administrator has not configured the printer to have a limit.
- 319 The following table specifies the integer values for the value-tag:

Tag Value (Hex)	Meaning
0x20	reserved
0x21	integer
0x22	boolean
0x23	enum
0x24-0x2F	reserved for future integer types

- NOTE: 0x20 is reserved for "generic integer" if it should ever be needed.
- 321 The following table specifies the octetString values for the value-tag:

Tag Value (Hex)	Meaning
0x30	octetString with an unspecified format
0x31	dateTime
0x32	resolution
0x33	rangeOfInteger
0x34	reserved for collection (in the future)
0x35	textWithLanguage
0x36	nameWithLanguage
0x37-0x3F	reserved for future octetString types

322 The following table specifies the character-string values for the value-tag:

Tag Value (Hex)	Meaning
0x40	reserved
0x41	textWithoutLanguage
0x42	nameWithoutLanguage
0x43	reserved
0x44	keyword
0x45	uri
0x46	uriScheme
0x47	charset
0x48	naturalLanguage
0x49	mimeMediaType
0x4A-0x5F	reserved for future character string types

- NOTE: 0x40 is reserved for "generic character-string" if it should ever be needed.
- NOTE: an attribute value always has a type, which is explicitly specified by its tag; one such tag value is
- "nameWithoutLanguage". An attribute's name has an implicit type, which is keyword.
- The values 0x60-0xFF are reserved for future types. There are no values allocated for private extensions. A new type MUST be
- registered via the type 2 registration process [ipp-mod].
- The tag 0x7F is reserved for extending types beyond the 255 values available with a single byte. A tag value of 0x7F MUST
- signify that the first 4 bytes of the value field are interpreted as the tag value. Note, this future extension doesn't affect parsers
- 330 that are unaware of this special tag. The tag is like any other unknown tag, and the value length specifies the length of a value
- which contains a value that the parser treats atomically. All these 4 byte tag values are currently unallocated except that the
- values 0x40000000-0x7FFFFFF are reserved for experimental use.

#### 3.8 Name-Length

333

339

342

343

344

345

346

347

348

349

362

363 364

365

366

367

368

369 370

371

372

373

374

- The name-length field MUST consist of a SIGNED-SHORT. This field MUST specify the number of octets in the name field which follows the name-length field, excluding the two bytes of the name-length field.
- 336 If a name-length field has a value of zero, the following name field MUST be empty, and the following value MUST be treated as
- an additional value for the preceding attribute. Within an attribute-sequence, if two attributes have the same name, the first
- occurrence MUST be ignored. The zero-length name is the only mechanism for multi-valued attributes.

#### 3.9 (Attribute) Name

- Some operation elements are called parameters in the model document [ipp-mod]. They MUST be encoded in a special position and they MUST NOT appear as an operation attributes. These parameters are:
  - "version-number": The parameter named "version-number" in the IPP model document MUST become the "version-number" field in the operation layer request or response.
    - "operation-id": The parameter named "operation-id" in the IPP model document MUST become the "operation-id" field in the operation layer request.
    - "status-code": The parameter named "status-code" in the IPP model document MUST become the "status-code" field in the operation layer response.
    - "request-id": The parameter named "request-id" in the IPP model document MUST become the "request-id" field in the operation layer request or response.
- All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [rfc2396] so that they can be persistently and
- unambiguously referenced. The notion of a URI is a useful concept, however, until the notion of URI is more stable (i.e.,
- defined more completely and deployed more widely), it is expected that the URIs used for IPP objects will actually be URLs
- 353 [rfc1738] [rfc1808]. Since every URL is a specialized form of a URI, even though the more generic term URI is used
- throughout the rest of this document, its usage is intended to cover the more specific notion of URL as well.
- Some operation elements are encoded twice, once as the request-URI on the HTTP Request-Line and a second time as a
- 356 REQUIRED operation attribute in the application/ipp entity. These attributes are the target URI for the operation and are called
- 357 printer-uri and job-uri. Note: The target URI is included twice in an operation referencing the same IPP object, but the two URIs
- NEED NOT be literally identical. One can be a relative URI and the other can be an absolute URI. HTTP/1.1 allows clients to
- 359 generate and send a relative URI rather than an absolute URI. A relative URI identifies a resource with the scope of the HTTP
- server, but does not include scheme, host or port. The following statements characterize how URLs should be used in the
- mapping of IPP onto HTTP/1.1:
  - 1. Although potentially redundant, a client MUST supply the target of the operation both as an operation attribute and as a URI at the HTTP layer. The rationale for this decision is to maintain a consistent set of rules for mapping application/ipp to possibly many communication layers, even where URLs are not used as the addressing mechanism in the transport layer.
  - 2. Even though these two URLs might not be literally identical (one being relative and the other being absolute), they MUST both reference the same IPP object.
  - 3. The URI in the HTTP layer is either relative or absolute and is used by the HTTP server to route the HTTP request to the correct resource relative to that HTTP server. The HTTP server need not be aware of the URI within the operation request.
  - 4. Once the HTTP server resource begins to process the HTTP request, it might get the reference to the appropriate IPP Printer object from either the HTTP URI (using to the context of the HTTP server for relative URLs) or from the URI within the operation request; the choice is up to the implementation.
  - 5. HTTP URIs can be relative or absolute, but the target URI in the operation MUST be an absolute URI.

383

393

375 The model document arranges the remaining attributes into groups for each operation request and response. Each such group

376 MUST be represented in the protocol by an xxx-attribute-sequence preceded by the appropriate xxx-attributes-tag (See the table

377 below and section 11 "Appendix A: Protocol Examples"). In addition, the order of these xxx-attributes-tags and xxx-attribute-

378 sequences in the protocol MUST be the same as in the model document, but the order of attributes within each xxx-attribute-

sequence MUST be unspecified. The table below maps the model document group name to xxx-attributes-sequence:

#### **Model Document Group**

#### xxx-attributes-sequence

Operation Attributes operations-attributes-sequence
Job Template Attributes job-attributes-sequence
Job Object Attributes job-attributes-sequence
Unsupported Attributes unsupported- attributes-sequence
Requested Attributes (Get-Job-Attributes) job-attributes-sequence

Requested Attributes (Get-Job-Attributes)

Requested Attributes (Get-Printer-Attributes)

printer-attributes-sequence

Document Content in a special position as described above

380 If an operation contains attributes from more than one job object (e.g. Get-Jobs response), the attributes from each job object

MUST be in a separate job-attribute-sequence, such that the attributes from the ith job object are in the ith job-attribute-sequence.

382 See Section 11 "Appendix A: Protocol Examples" for table showing the application of the rules above.

#### 3.10 Value Length

- Each attribute value MUST be preceded by a SIGNED-SHORT, which MUST specify the number of octets in the value which
- follows this length, exclusive of the two bytes specifying the length.
- For any of the types represented by binary signed integers, the sender MUST encode the value in exactly four octets.
- For any of the types represented by character-strings, the sender MUST encode the value with all the characters of the string and
- without any padding characters.
- 389 If a value-tag contains an "out-of-band" value, such as "unsupported", the value-length MUST be 0 and the value empty the
- 390 value has no meaning when the value-tag has an "out-of-band" value. If a client receives a response with a nonzero value-length
- in this case, it MUST ignore the value field. If a printer receives a request with a nonzero value-length in this case, it MUST
- 392 reject the request.

#### 3.11 (Attribute) Value

- The syntax types and most of the details of their representation are defined in the IPP model document. The table below augments
- 395 the information in the model document, and defines the syntax types from the model document in terms of the 5 basic types
- defined in section 3 "Encoding of the Operation Layer". The 5 types are US-ASCII-STRING, LOCALIZED-STRING,
- 397 SIGNED-INTEGER, SIGNED-SHORT, SIGNED-BYTE, and OCTET-STRING.

Syntax of Attribute Value	Encoding
textWithoutLanguage, nameWithoutLanguage	LOCALIZED-STRING.
textWithLanguage	OCTET_STRING consisting of 4 fields:  a) a SIGNED-SHORT which is the number of octets in the following field b) a value of type natural-language, c) a SIGNED-SHORT which is the number of octets in the following field,

Syntax of Attribute Value	Encoding
	d) a value of type textWithoutLanguage.
	The length of a textWithLanguage value MUST be $4 +$ the value of field $a +$ the value of field $c$ .
nameWithLanguage	OCTET_STRING consisting of 4 fields:  a) a SIGNED-SHORT which is the number of octets in the following field b) a value of type natural-language, c) a SIGNED-SHORT which is the number of octets in the following field d) a value of type nameWithoutLanguage.
	The length of a nameWithLanguage value MUST be $4 +$ the value of field $a +$ the value of field $c$ .
charset, naturalLanguage, mimeMediaType, keyword, uri, and uriScheme	US-ASCII-STRING.
boolean	SIGNED-BYTE where 0x00 is 'false' and 0x01 is 'true'.
integer and enum	a SIGNED-INTEGER.
dateTime	OCTET-STRING consisting of eleven octets whose contents are defined by "DateAndTime" in RFC 1903 [rfc1903].
resolution	OCTET_STRING consisting of nine octets of 2 SIGNED-INTEGERs followed by a SIGNED-BYTE. The first SIGNED-INTEGER contains the value of cross feed direction resolution. The second SIGNED-INTEGER contains the value of feed direction resolution. The SIGNED-BYTE contains the units value.
rangeOfInteger	Eight octets consisting of 2 SIGNED-INTEGERs. The first SIGNED-INTEGER contains the lower bound and the second SIGNED-INTEGER contains the upper bound.
1setOf X	Encoding according to the rules for an attribute with more than 1 value. Each value X is encoded according to the rules for encoding its type.
octetString	OCTET-STRING

The type of the value in the model document determines the encoding in the value and the value of the value-tag.

#### **3.12** Data

399

401

400 The data part MUST include any data required by the operation

## 4. Encoding of Transport Layer

402 HTTP/1.1 [rfc2068] is the transport layer for this protocol.

- The operation layer has been designed with the assumption that the transport layer contains the following information:
- the URI of the target job or printer operation
- the total length of the data in the operation layer, either as a single length or as a sequence of chunks each with a length.
- It is REQUIRED that a printer implementation support HTTP over the IANA assigned Well Known Port 631 (the IPP default port), though a printer implementation may support HTTP over some other port as well.
- Each HTTP operation MUST use the POST method where the request-URI is the object target of the operation, and where the
- 409 "Content-Type" of the message-body in each request and response MUST be "application/ipp". The message-body MUST
- 410 contain the operation layer and MUST have the syntax described in section 3.2 "Syntax of Encoding". A client implementation
- 411 MUST adhere to the rules for a client described for HTTP1.1 [rfc2068] . A printer (server) implementation MUST adhere the
- rules for an origin server described for HTTP1.1 [rfc2068].
- An IPP server sends a response for each request that it receives. If an IPP server detects an error, it MAY send a response before
- 414 it has read the entire request. If the HTTP layer of the IPP server completes processing the HTTP headers successfully, it MAY
- send an intermediate response, such as "100 Continue", with no IPP data before sending the IPP response. A client MUST
- expect such a variety of responses from an IPP server. For further information on HTTP/1.1, consult the HTTP documents
- 417 [rfc2068].

433

434

440

441

442

443 444

- An HTTP server MUST support chunking for IPP requests, and an IPP client MUST support chunking for IPP responses
- according to HTTP/1.1[rfc2068]. Note: this rule causes a conflict with non-compliant implementations of HTTP/1.1 that don't
- support chunking for POST methods, and this rule may cause a conflict with non-compliant implementations of HTTP/1.1 that
- don't support chunking for CGI scripts

### 5. IPP URL Scheme

- The IPP/1.1 specification defines a new scheme 'ipp' as the value of a URL that identifies either an IPP printer object or an IPP
- 424 job object. The IPP attributes using the 'ipp' scheme are specified below. Because the HTTP layer does not support the 'ipp'
- scheme, a client MUST map 'ipp' URLs to 'http' URLs, and then follows the HTTP [RFC2068] [RFC2069] rules for constructing a
- Request-Line and HTTP headers. The mapping is simple because the 'pp' scheme implies all of the same protocol semantics as
- 427 that of the 'http' scheme [RFC2068], except that it represents a print service and the implicit (default) port number that clients use
- 428 to connect to a server is port 631.
- In the remainder of this section the term 'ipp-URL' means a URL whose scheme is 'ipp' and whose implicit (default) port is 631.
- The term 'http-URL' means a URL whose scheme is 'http', and the term 'https-URL' means a URL whose scheme is 'https',
- A client and an IPP object (i.e. the server) MUST support the ipp-URL value in the following IPP attributes.
- 432 job attributes:
  - job-uri
  - job-printer-uri
- 435 printer attributes:
- 436 printer-uri-supported
- 437 operation attributes:
- 438 job-uri
- 439 printer-uri

Each of the above attributes identifies a printer or job object. The ipp-URL is intended as the value of the attributes in this list, and for no other attributes. All of these attributes have a syntax type of 'uri', but there are attributes with a syntax type of 'uri' that do not use the 'ipp' scheme, e.g. 'job-more-info'.

445 If a printer registers its URL with a directory service, the printer MUST register an ipp-URL.

User interfaces are beyond the scope of this document. But if software exposes the ipp-URL values of any of the above five attributes to a human user, it is REQUIRED that the human see the ipp-URL as is.

The client MUST use the target http-URL in both the HTTP Request-Line and HTTP headers, as specified by

448 449

450

452

453

454

When a client sends a request, it MUST convert a target ipp-URL to a target http-URL for the HTTP layer according to the following rules:

- 1. change the "ipp' scheme to 'http'
  - 2. add an explicit port 631 if the URL does not contain an explicit port. Note: port 631 is the IANA assigned Well Known Port for the 'ipp' scheme.

455 HTTP[ 456 operation

HTTP[RFC2068][RFC2069]. However, the client MUST use the target ipp-URL for the value of the "printer-uri" or "job-uri" operation attribute within the application/ipp body of the request. The server MUST use the ipp-URL for the value of the "printer-uri", "job-uri" or "printer-uri-supported" attributes within the application/ipp body of the response.

457 458 459

For example, when an IPP client sends a request directly (i.e. no proxy) to an ipp-URL "ipp://myhost.com/myprinter/myqueue", it opens a TCP connection to port 631 (the ipp implicit port) on the host "myhost.com" and sends the following data:

460 461 462

467

468

470

471

```
    462 POST /myprinter/myqueue HTTP/1.1
    463 Host: myhost.com:631
    464 Content-type: application/ipp
    465 Transfer-Encoding: chunked
```

465 T 466 ...

"printer-uri" "ipp://myhost.com/myprinter/myqueue"

(encoded in application/ipp message body)

469 ...

As another example, when an IPP client sends the same request as above via a proxy "myproxy.com", it opens a TCP connection to the proxy port 8080 on the proxy host "myproxy.com" and sends the following data:

472 473

477

474 POST http://myhost.com:631/myprinter/myqueue HTTP/1.1

475 Host: myhost.com:631

476 Content-type: application/ipp

Transfer-Encoding: chunked

478

"printer-uri" "ipp://myhost.com/myprinter/myqueue"(encoded in application/ipp message body)

481 482 483

484

The proxy then connects to the IPP origin server with headers that are the same as the "no-proxy" example above.

## 6. Compatibility with IPP/1.0 Implementations

IPP/1.1 implementations must be compatible with IPP 1.0 implementations, as defined in [ipp-mod-10] and [ipp-pro-10] documents. For compatibility with IPP/1.0 implementations, IPP objects (i.e. a server) MUST support additional schemes when communicating with IPP/1.0 clients as described in this section:

188	If a server receives an IPP/1.0 request, it MUST return an IPP/1.0 response. That is, it MUST support both an http-URL
189	and an https-URL in the target "printer-uri" and "job-uri" operation attributes in a request. The rules for attributes in a
190	response is covered in the next two bullet items.

When a server returns the printer attribute "printer-uri-supported", it MUST return all values of the attribute for an IPP/1.1 request. For an IPP/1.0 request, a server MUST return a subset of the attribute values, excluding those that are ipp-URLs, and including those that are http-URLs and https-URLs..

The table below shows the type of URL that a server returns for the "job-uri" and "job-printer-uri" job attributes for all operations based on how the job was created.

Operation attributes for a	Job created via			
request	ipp	secure ipp	http	https
ipp	ipp	No URL returned	ipp	No URL returned
secure ipp	ipp	ipp	ipp	ipp
http	http	No URL returned	http	No URL returned
https	http	https	http	https

497

498

☐ If a server registers a nonsecure ipp-URL with a name service, then it MUST also register an http-URL. If a printer supports a secure connection using SSL3, then it MUST register an https-URL.

499 500

501

513

## 7. Security Considerations

- The IPP Model document defines an IPP implementation with "privacy" as one that implements Transport Layer Security (TLS) [rfc2246]. TLS meets the requirements for IPP security with regards to features such as mutual authentication and privacy (via encryption). The IPP Model document also outlines IPP-specific security considerations and should be the primary reference for security implications with regards to the IPP protocol itself.
- The IPP Model document defines an IPP implementation with "authentication" as one that implements the standard way for transporting IPP messages within HTTP 1.1. These include the security considerations outlined in the HTTP 1.1 standard document [rfc2068] and Digest Access Authentication extension [rfc2069].
- The current HTTP infrastructure supports HTTP over TCP port 80. IPP server implementations MUST offer IPP services using HTTP over the IANA assigned Well Known Port 631 (the IPP default port). IPP server implementations may support other ports, in addition to this port.
- See further discussion of IPP security concepts in the model document [ipp-mod].

#### 7.1 Using IPP with TLS

- An initial IPP request never uses TLS. The switch to TLS occurs either because the server grants the client's request to upgrade
- 515 to TLS, or a server asks to switch to TLS in its response. Secure communication begins with a server's response to switch to TLS.
- 516 During the TLS handshake, the original session is preserved.
- An IPP client that wants a secure connection MUST send "TLS/1.0" as one of the field-values of the Upgrade request header, e.g.
- 518 "Upgrade: TLS/1.0" (see rfc2068 section 14.42). If the origin-server grants the upgrade request, it MUST respond with "101
- Switching Protocols", and it MUST include the header "Upgrade: TLS/1.0" to indicate what it is switching to. An IPP client
- 520 MUST be ready to react appropriately if the server does not grant the upgrade request. Note: the 'Upgrade header' mechanism
- allows unsecured and secured traffic to share the same port (in this case, 631).

- With current technology, an IPP server can indicate that it wants an upgrade only by returning "401 unauthorized" or "403
- 523 forbidden". A server MAY give the client an additional hint by including an "Upgrade: TLS" header in the response. When an
- IPP client receives such a response, it can perform the request again with an Upgrade header with the "TLS/1.0" value.
- 525 If a server supports TLS, it SHOULD include the "Upgrade" header with the value "TLS/1.0" in response to any OPTIONS
- 526 request.
- 527 Upgrade is a hop-by-hop header (rfc2068, section 13.5.1), so each intervening proxy which supports TLS MUST also request the
- same version of TLS/1.0 on its subsequent request. Furthermore, any caching proxy which supports TLS MUST NOT reply from
- 529 its cache when TLS/1.0 has been requested (although clients are still recommended to explicitly include "Cache-control: no-
- 530 cache").

- Note: proxy servers may be able to request or initiate a TLS-secured connection, e.g. the outgoing or incoming firewall of a
- trusted subnetwork.
- Note: the initial connection (containing the Upgrade header) is not secure. Any client expecting a secure connection should first
- use a non-sensitive operation (e.g. an HTTP POST with an empty message body) to establish a secure connection before sending
- 535 any sensitive data.

## 11. Appendix A: Protocol Examples

#### 11.1 Print-Job Request

The following is an example of a Print-Job request with job-name, copies, and sides specified. The "ipp-attribute-fidelity" attribute is set to 'true' so that the print request will fail if the "copies" or the "sides" attribute are not supported or their values are not supported.

## 11.2 Print-Job Response (successful)

587

588

589

Here is an example of a successful Print-Job response to the previous Print-Job request. The printer supported the "copies" and "sides" attributes and their supplied values. The status code returned is 'successful-ok'.

Octets	Symbolic Value	<b>Protocol field</b>
0x0101	1.1	version-number

Octets	Symbolic Value	Protocol field

## 11.3 Print-Job Response (failure)

590

591

592

593

594 595 Here is an example of an unsuccessful Print-Job response to the previous Print-Job request. It fails because, in this case, the printer does not support the "sides" attribute and because the value '20' for the "copies" attribute is not supported. Therefore, no job is created, and neither a "job-id" nor a "job-uri" operation attribute is returned. The error code returned is 'client-error-attributes-or-values-not-supported' (0x040B).

Octets	Symbolic Value	Protocol field
0x0101 0x040B 0x00000001 0x01 0x47 0x0012	1.1 client-error-attributes-or-values-not-supported 1 start operation-attributes charset type	version-number status-code request-id operation-attribute tag value-tag name-length

0x03	end-of-attributes	end-of-attributes-tag

#### 11.4 Print-Job Response (success with attributes ignored)

Here is an example of a successful Print-Job response to a Print-Job request like the previous Print-Job request, except that the value of 'ipp-attribute-fidelity' is false. The print request succeeds, even though, in this case, the printer supports neither the "sides" attribute nor the value '20' for the "copies" attribute. Therefore, a job is created, and both a "job-id" and a "job-uri" operation attribute are returned. The unsupported attributes are also returned in an Unsupported Attributes Group. The error code returned is 'successful-ok-ignored-or-substituted-attributes' (0x0001).

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number

# 12. Appendix C: Registration of MIME Media Type Information for "application/ipp"

- This appendix contains the information that IANA requires for registering a MIME media type. The information following this
- paragraph will be forwarded to IANA to register application/ipp whose contents are defined in Section 3 "Encoding of the
- Operation Layer" in this document:
- 618 **MIME type name:** application
- 619 MIME subtype name: ipp
- 620 A Content-Type of "application/ipp" indicates an Internet Printing Protocol message body (request or response). Currently there
- are two versions: IPP/1.0, and IPP/1.1, whose syntax is described in Section 3 "Encoding of the Operation Layer" of [ipp-pro-
- 622 10] and [ipp-pro], respectively, and whose semantics are described in [ipp-mod-10] and [ipp-mod], respectively.
- 623 Required parameters: none
- 624 **Optional parameters:** none
- 625 Encoding considerations:
- 626 IPP/1.1 protocol requests/responses MAY contain long lines and ALWAYS contain binary data (for example attribute value
- 627 lengths).
- 628 Security considerations:
- 629 IPP/1.1 protocol requests/responses do not introduce any security risks not already inherent in the underlying transport protocols.
- Protocol mixed-version interworking rules in [ipp-mod] as well as protocol encoding rules in [ipp-pro] are complete and
- 631 unambiguous.
- 632 Interoperability considerations:
- IPP/1.1 requests (generated by clients) and responses (generated by servers) MUST comply with all conformance requirements
- imposed by the normative specifications [ipp-mod] and [ipp-pro]. Protocol encoding rules specified in [ipp-pro] are
- comprehensive, so that interoperability between conforming implementations is guaranteed (although support for specific
- optional features is not ensured). Both the "charset" and "natural-language" of all IPP/1.1 attribute values which are a
- 637 LOCALIZED-STRING are explicit within IPP protocol requests/responses (without recourse to any external information in
- 638 HTTP, SMTP, or other message transport headers).
- 639 IPP/1.1 servers MUST support both IPP/1.0 and IPP/1.1. See the section in [ipp-pro] entitled "Compatibility with IPP/1.0
- Implementations" for a discussion of compatibility with IPP/1.0.
- **Published specification:**
- [ipp-mod-10] Isaacson, S., deBry, R., Hastings, T., Herriot, R., Powell, P., "Internet Printing Protocol/1.0: Model and Semantics" draft-ietf-ipp-model-11.txt, November, 1998.
- [ipp-mod] Isaacson, S., deBry, R., Hastings, T., Herriot, R., Powell, P., "Internet Printing Protocol/1.1: Model and Semantics" draft-ietf-ipp-model-v11-00.txt, February, 1999.
- 646 [ipp-pro] Herriot, R., Butler, S., Moore, P., Turner, R., "Internet Printing Protocol/1.1: Encoding and Transport", draft-ietf-647 ipp-protocol-v11-00.txt, February, 1999.

#### Applications which use this media type:

- Internet Printing Protocol (IPP) print clients and print servers, communicating using HTTP/1.1 (see [IPP-PRO]), SMTP/ESMTP,
- FTP, or other transport protocol. Messages of type "application/ipp" are self-contained and transport-independent, including
- "charset" and "natural-language" context for any LOCALIZED-STRING value.

## 13. Appendix D: Notices

- The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to
- 672 pertain to the implementation or use of the technology described in this document or the extent to which any license under such
- 673 rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information
- on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-
- 11[BCP-11]. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or
- the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or
- users of this specification can be obtained from the IETF Secretariat.
- The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary
- rights which may cover technology that may be required to practice this standard. Please address the information to the IETF
- 680 Executive Director.
- 681 Copyright (C)The Internet Society (1999). All Rights Reserved
- This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise
- explain it or assist in its implementation may be prepared, copied, published and distributed, in whole or in part, without
- restriction of any kind, provided that the above copyright notice and this paragraph are included on all such copies and derivative
- works. However, this document itself may not be modified in any way, such as by removing the copyright notice or references to
- the Internet Society or other Internet organizations, except as needed for the purpose of developing Internet standards in which

- case the procedures for copyrights defined in the Internet Standards process must be followed, or as required to translate it into languages other than English.
- The limited permissions granted above are perpetual and will not be revoked by the Internet Society or its successors or assigns.
- This document and the information contained herein is provided on an "AS IS" basis and THE INTERNET SOCIETY AND

- 693 ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR
- 694 PURPOSE.

## 14. Appendix E: Changes from IPP /1.0

- 696 IPP/1.1 is identical to IPP/1.0 with the follow changes:
- 697 1. Attributes values that identify a printer or job object use a new 'ipp' scheme. The 'http' and 'https' schemes are supported only for backward compatibility.
- 699 2. TLS provides security. SSL3 is supported only for backward compatibility.
