Printer MIB v2
<draft-ietf-printmib-mib-info-09.txt>

Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of RFC 2026 [17].

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or made obsolete by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

To learn the current status of any Internet-Draft, please check the "1id-abstracts-txt" listing contained in the Internet-Drafts Shadow Directories on ftp.is.co.za (Africa), nic.nordu.net (Europe), munnari.oz.au (Pacific Rim), ftp.ietf.org (US East Coast), or ftp.isi.edu (US West Coast).

For tips on printing this document or on modifying the original Microsoft Word source document, see [1].

Abstract

This document provides definitions of models and manageable objects for printing environments. The objects included in this MIB apply to physical, as well as logical entities within a printing device. This

MIB definition makes explicit references to the Host Resources MIB (RFC 2790 [28]), as well as the Interfaces Group of MIB-II (RFC 1213 [14]). This document obsoletes RFC 1759.

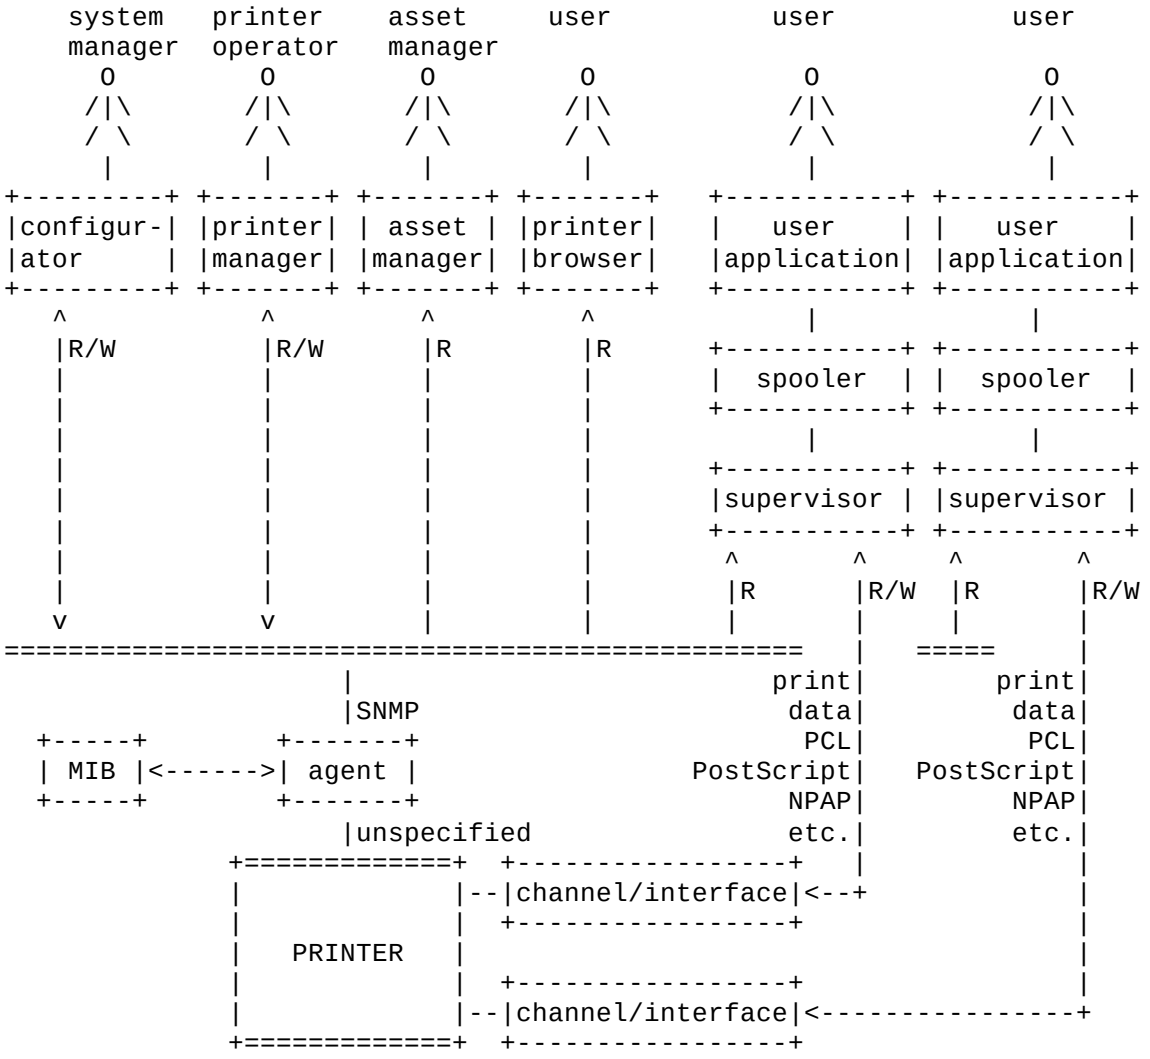
1. Introduction

1.1 Network Printing Environment

The management of producing a printed document, in any computer environment, is a complex subject. Basically, the task can be divided into two overlapping pieces, the management of printing and the management of the printer. Printing encompasses the entire process of producing a printed document from generation of the file to be printed, selection of a printer, choosing printing properties, routing, queuing, resource management, scheduling, and final printing including notifying the user. Most of the printing process is outside the scope of the model presented here; only the management of the printer is covered.

Figure 1 - One Printer's View of the Network



1.2 Printer Device Overview

A printer is the physical device that takes media from an input source, produces marks on that media according to some page description or page control language and puts the result in some output destination, possibly with finishing applied. Printers are complex devices that consume supplies, produce waste and may have

mechanical problems. In the management of the physical device the description, status and alert information concerning the printer and its various subparts has to be made available to the management application so that it can be reported to the end user, key operators for the replenishment of supplies or the repair or maintenance of the device. The information needed in the management of the physical printer and the management of a printing job overlap highly and many of the tasks in each management area require the same or similar information.

1.3 Categories of Printer Information

Information about printers is classified into three basic categories: descriptions, status and alerts.

1.3.1 Descriptions

Descriptions convey information about the configuration and capabilities of the printer and its various sub-units. This information is largely static information and does not generally change during the operation of the system but may change as the printer is repaired, reconfigured or upgraded. The descriptions are one part of the visible state of the printer where state means the condition of being of the printer at any point in time.

1.3.2 Status

Status is the information regarding the current operating state of the printer and its various sub-units. Status is the rest of the visible state of the printer. As an example of the use of status, a management application must be able to determine if the various sub-units are ready to print or are in some state that prevents printing or may prevent printing in the future.

1.3.3 Alerts

An Alert is the representation of a reportable event in the printer. An event is a change in the state of the printer. Some of those state changes are of interest to a management application and are therefore reportable. Typically, these are the events that affect the printer's ability to print. Alerts usually occur asynchronously to the operation of the computer system(s) to which the printer is attached. For convenience below, "alert" will be used for both the event caused by a change in the printer's state and for the representation of that event.

Alerts can be classified into two basic categories, critical and non-critical. A critical alert is one that is triggered by entry into a state in which the printer is stopped and printing can not continue until the condition that caused the critical alert is eliminated. "Out of paper", "toner empty" and "output bin full" are examples of critical alerts. Non-critical alerts are triggered by those events that enter a state in which printing is not stopped. Such a non-critical state may, at some future time, lead to a state in which printing may be stopped. Examples of these kinds of non-critical alerts are "input media low", "toner low" and "output bin nearly full". Or, a non-critical alert may simply provide information, such as signaling a configuration changed in the printer.

Description, status and alert information about the printer can be thought of as a database describing the printer. The management application for a printer will want to view the printer data base differently depending on how and for what purposes the information in the database is needed.

1.4 The SNMP Management Framework

The SNMP Management Framework presently consists of five major components:

- An overall architecture, described in RFC 2571 [RFC2571].
- Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIv1 and described in STD 16, RFC 1155 [RFC1155], STD 16, RFC 1212 [RFC1212] and RFC 1215 [RFC1215]. The second version, called SMIv2, is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].
- Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, RFC 1157 [RFC1157]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in RFC 1901 [RFC1901] and RFC 1906 [RFC1906]. The third version of the message protocol is called SNMPv3 and described in RFC 1906 [RFC1906], RFC 2572 [RFC2572] and RFC 2574 [RFC2574].
- Protocol operations for accessing management information. The

first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [RFC1157]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [RFC1905].

- o A set of fundamental applications described in RFC 2573 [RFC2573] and the view-based access control mechanism described in RFC 2575 [RFC2575].

A more detailed introduction to the current SNMP Management Framework can be found in RFC 2570 [RFC2570].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

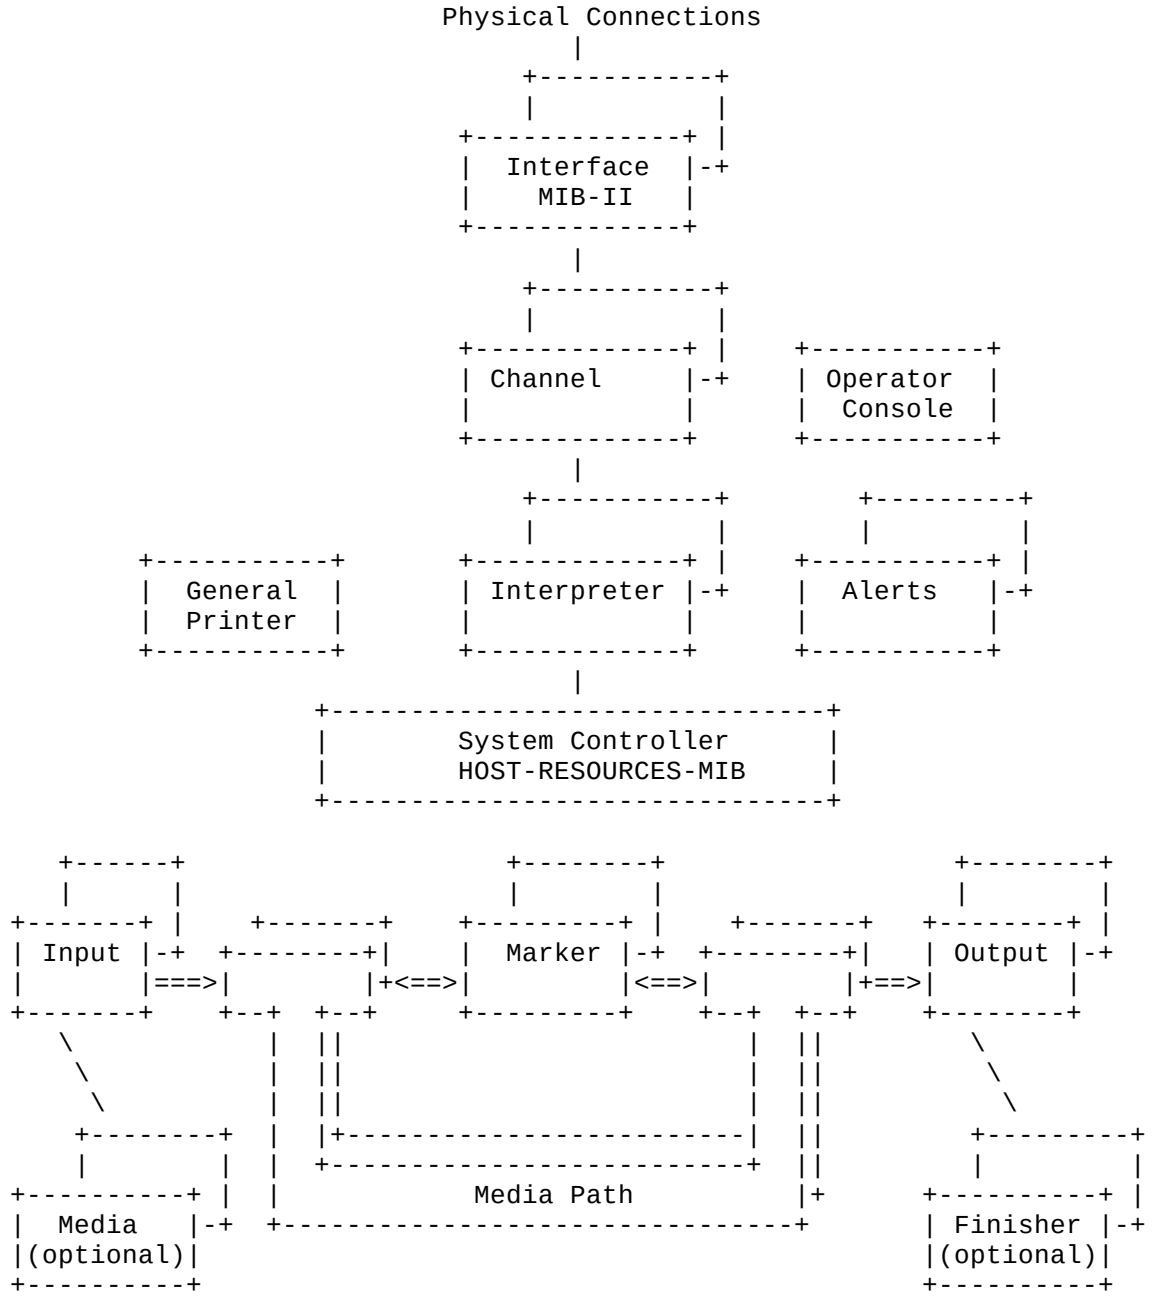
This memo specifies a MIB module that is compliant to the SMIv2. A MIB conforming to the SMIv1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (use of Counter64). Some machine readable information in SMIv2 will be converted into textual descriptions in SMIv1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

2. Printer Model

In order to accomplish the management of the printer, an abstract model of the printer is needed to represent the sub-units from which the printer is composed. A printer can be described as consisting of 13 types of sub-units. It is important to note that the sub-units of a printer do not necessarily relate directly to any physically identifiable mechanism. Sub-units can also be a set of definable logical processes, such as interpreters for page description languages or command processors that set various operating modes of the printer.

Figure 2 shows a block diagram of the printer and its basic 13 sub-units.

Figure 2 - Printer Block Diagram



2.1 Overview of the Printer Model

The model has three basic parts: (1) the flow of a print file into an interpreter and onto the marker, (2) the flow of media through the marker and (3) the auxiliary sub-units that control and facilitate the two prior flows. The flow of the print data comes through a physical connection on which some form of transport protocol stack is running. The data provided by the transport protocol (interface) appears on a channel, which is the input to an interpreter. The interpreter converts the print data into a form suitable for marking on the media.

The media resides in Input sub-units from which the media is selected and then transported via a Media Path first to a Marking sub-unit and then onto an Output sub-unit with (optionally) some finishing operations being performed. The auxiliary sub-units facilitate control of the printer, inquiry/control of the operator panel, reporting of alerts and the adaptation of the printer to various natural languages and characters sets. All the software sub-units run on the System Controller that represents the processor, memory and storage systems of the Printer. Each of the sub-units is discussed in more detail below.

All of the sub-units other than the Alerts report only state information, either a description or a status. The Alerts sub-unit reports event information.

2.2 Printer Sub-Units

A printer is composed of 13 types of sub-units, called groups. The following sections describe the different types of sub-units.

2.2.1 General Printer

The general printer sub-unit is responsible for the overall control and status of the printer. There is exactly one general printer sub-unit in a printer. The General Printer Group in the model represents the general printer sub-unit. In addition to the providing the status of the whole printer and allowing the printer to be reset, this Group provides information on the status of the packaging of the printer, in particular, the covers. The general printer sub-unit is usually implemented on the system controller.

2.2.1.1 International Considerations

The localization portion of the general printer sub-unit is responsible for identifying the natural language, country, and character set in which certain character strings are expressed in this MIB.

There may be one or more localizations supported per printer. The available localizations are specified in the Localization table. Localization SHOULD only be performed on string objects which are named 'xxxDescription' (sub-unit descriptions) or 'prtConsoleDisplayBufferText' (local console text).

The agent SHALL return all other character strings in coded character sets in which code positions 0-127 (decimal) are US-ASCII [6]. The agent SHOULD return all other character strings in the UTF-8 (RFC 2279 [21]) transform of ISO 10646 [8], to conform with the IETF Policy on Character Sets and Languages (RFC 2277 / BCP 18 [19]). Control codes (code positions 0-31 and 127 decimal) SHALL NOT be used unless specifically required in the DESCRIPTION of an object.

The character set portion of the general printer Localization table is responsible for identifying the possible character sets for the operator console, and network management requests for display objects. There may be one or more character sets per printer. Default coded character sets for interpreter unit and output octets are described in the interpreter sub-unit by prtInterpreterDefaultCharSetIn and prtInterpreterDefaultCharSetOut. These input/output character sets may be overridden by commands in the interpreter language itself.

2.2.2 Inputs

Input sub-units are mechanisms that feed media to be marked on into the printer. A printer contains one or more input sub-units. The Input Group in the model represents these. The model does not distinguish fixed input bins from removable trays, except to report when a removable tray has been removed.

There are as many input sub-units as there are distinctly selectable input "addresses". For example, if one tray has both a manual and auto feeding option, then this is two input sub-units if these two sources can be (must be) separately selected. However, the above would be considered one input sub-unit if putting a sheet in the manual feed slot overrides feeding from the contents of the tray. In

the second case there is no way to separately select or address the manual feed slot.

2.2.3 Media

An input sub-unit can hold one or more instances of the media on which marking is to be done. Typically, there is a large set of possible media that can be associated with an input. The Media Group is an extension of the Input Group, which represents media in an input sub-unit. The Media Group only describes the current contents of each input and not the possible content of the input sub-unit.

2.2.4 Outputs

Output sub-units are mechanisms that receive media that has been marked on. The Output Group in the model represents the one or more output mechanisms contained by a printer. The model does not distinguish fixed output bins from removable output bins, except to report when a removable bin has been removed.

There are as many output sub-units as there are distinctly selectable output "addresses". Output sub-units can be addressed in two different ways: (1) as a set of "mailboxes" which are addressed by a specific mailbox selector such as a bin number or a bin name, or (2) as a set of "slots" into which multiple copies are collated. Sometimes both modes of using the output sub-units can be used on the same printer. All that is important from the viewpoint of the model is that the output units can be separately selected.

2.2.5 Finishers

A finisher is a sub-unit that performs some operations on the media other than marking. The Finisher Group in the model represents the finisher sub-units. Some examples of finishing processes are stapling, punching, binding, inserting, or folding. Finishing processes may have supplies associated with the process. Stapling, binding, and punching are examples of processes that have supplies. A printer may have more than one finishing sub-unit and each finishing sub-unit may be associated with one or more output sub-units. Finishers are not described in this MIB.

The model does not specify the exact interaction and sequencing between an output device and its associated finisher. It depends on the type of finishing process and the exact implementation of the printer system. This standard allows for the logical association of a

finishing process with an output device but does not put any restrictions on the exact sequence or interaction with the associated output device. The output and finisher sub-units may or may not be separate identifiable physical mechanisms depending on the exact implementation of a printer. In addition, a single output device may be associated with multiple finishing sub-units and a single finishing sub-unit may be associated with multiple output devices.

2.2.6 Markers

A marker is the mechanism that produces marks on the print media. The Marker Group in the model represents the marker sub-units and their associated supplies. A printer can contain one or more marking mechanisms. Some examples of multiple marker sub-units are a printer with separate markers for normal and magnetic ink or an imagesetter that can output to both a proofing device and final film. Each marking device can have its own set of characteristics associated with it, such as marking technology and resolution.

In this model the marker sub-unit is viewed as very generalized and encompasses all aspects of a marking process. For example, in a xerographic process, the marking process as well as the fusing process would be included in the generalized concept of the marker. With the generalized concept of a marking process, the concept of multiple marking supplies associated with a single marking sub-unit results. For example, in the xerographic process, there is not only a supply of toner, but there can also be other supplies such as a fuser supply (e.g., fuser oil) that can be consumed and replaced separately. In addition there can be multiple supplies of toner for a single marker device, as in a color process.

2.2.7 Media Paths

The media paths encompass the mechanisms in the printer that move the media through the printer and connect all other media related sub-units: inputs, outputs, markers and finishers. A printer contains one or more media paths. The Media Path Group in the model represents these. The Media Path group has some objects that apply to all paths plus a table of the separate media paths.

In general, the design of the media paths determines the maximum speed of the printer as well as the maximum media size that the printer can handle. Media paths are complex mechanisms and can contain many different identifiable sub-mechanisms such as media movement devices, media buffers, duplex units and interlocks. Not all

of the various sub-mechanisms reside on every media path. For example, one media path may provide printing only on one surface of the media (a simplex path) and another media path may have a sub-mechanism that turns the media over and feeds it a second time through the marker sub-unit (a duplex path). The duplex path may even have a buffer sub-mechanism that allows multiple copies of the obverse side to be held before the reverse side of all the copies is marked.

2.2.8 System Controller

The System Controller is the sub-unit upon which the software components of the Printer run. The Host Resources MIB represents the System Controller in the model. This MIB allows for the specification of the processor(s), memory, disk storage, file system and other underlying sub-mechanisms of the printer. The controller can range from simple single processor systems to multiprocessor systems. In addition, controllers can have a full range of resources such as hard disks. The printer is modeled to have one system controller even though it may have more than one processor and multiple other resources associated with it.

2.2.9 Interfaces

An interface is the communications port and associated protocols that are responsible for the transport of data to the printer. A printer has one or more interface sub-units. The interfaces are represented by the Interfaces Group of MIB-II (RFC 1213 [14]). Some examples of interfaces are serial ports (with little or no protocol) and Ethernet ports on which one might run Internet IP, Novell IPX, etc.

2.2.10 Print Job Delivery Channels

The print job delivery channel sub-units identify the independent sources of print data (here print data is the information that is used to construct printed pages and may have both data and control aspects). A printer may have one or more channels. The channel sub-units are represented by the Print Job Delivery Channel Group in the Model. The electronic path typically identifies each channel and service protocol used to deliver print data to the printer. A channel sub-unit may be independently enabled (allowing print data to flow) or disabled (stopping the flow of print data). It has a current Control Language that can be used to specify which interpreter is to be used for the print data and to query and change environment variables used by the interpreters (and SNMP). There is also a

default interpreter that is to be used if an interpreter is not explicitly specified using the Control Language. Print Job Delivery Channel sub-units can, and usually are, based on an underlying interface.

2.2.11 Interpreters

The interpreter sub-units are responsible for the conversion of a description of intended print instances into images that are to be marked on the media. A printer may have one or more interpreters. The Interpreter Group in the Model represents the interpreter sub-units. Each interpreter is generally implemented with software running on the System Controller sub-unit. The Interpreter Table has one entry per interpreter where the interpreters include both Page Description Language (PDL) Interpreters and Control Language Interpreters.

2.2.12 Console

Many printers have a console on the printer, the operator console that is used to display and modify the state of the printer. The console can be as simple as a few indicators and switches or as complicated as full screen displays and keyboards. There can be at most one such console. The Console Group in the model represents this console sub-unit. Although most of the information displayed there is also available in the state of the printer as represented by the various Groups, it is useful to be able to query and modify the operator console remotely. For example, a management application might like to display to its user the current message on the operator console of the remote printer or the management application user might like to modify the current message on the operators console of the remote printer. As another example, one might have a remote application that puts up a pseudo console on a workstation screen. Since the rules by which the printer state is mapped onto the console and vice versa are not standardized, it is not possible to reproduce the console state or the action of console buttons and menus. Therefore, the Console Group provides access to the console. The operator console is usually implemented on the system controller with additional hardware for input and display.

2.2.13 Alerts

The alert sub-unit is responsible for detecting reportable events, making an entry in the alert table and, if and only if the event is a critical event, initiating a trap. The exception to this rule is when the "alertRemovalofBinaryChangeEntry" trap is generated. The alert

sub-unit is represented by the Alerts Group and, in particular, the Alert Table. This table contains information on the severity, sub-unit, and detailed location within the sub-unit, alert code and description of each critical alert that is currently active within the printer. Each reportable event causes an entry to be made in the Alert Table.

2.2.13.1 Status and Alerts

Summary information about the state of the printer is reported at three separate levels: (1) The status of the printer as a whole is reported in the Host Resources MIB, (2) The status of various sub-units is reported in the principle table of the Group that represents the sub-unit, and (3) Alert codes are reported in the Alert Table.

2.2.13.2 Overall Printer Status

Of the many states a printer can be in, certain states are more "interesting" because of the distinct actions they are likely to provoke in the administrator. These states may be applied to the printer as a whole, or to a particular sub-unit of the printer. These named states are:

Non Critical Alert Active - For the printer this means that one or more sub-units have a non-critical alert active. For a sub-unit, this means that the sub-unit has a non-critical alert active.

Critical Alert Active - For the printer this means that one or more sub-units have a critical alert active. For a sub-unit, this means that the sub-unit has a critical alert active.

Unavailable - The printer or sub-unit is unavailable for use (this is the same as "broken" or "down" in other terminology). A trained service person is typically necessary to make it available.

Moving on-line or off-line - The printer is either off-line, in the process of moving off-line or moving back on-line. For example, on printers with motorized hoppers, reloading paper involves a transition to off-line to open the paper bin, filling the hopper and, finally, a transition back to on-line as the paper bin is repositioned for printing.

Standby - The printer or sub-unit is not immediately available but can accept new instructions.

Available - The printer or subunit is functioning normally.

Idle - The printer or subunit is immediately available.

Active - The printer or subunit is performing its primary function.

Busy - The printer or subunit is performing a function (not necessarily its primary function) and is not immediately available for its primary function.

The Host Resources MIB (RFC 2790 [28]) provides three status objects that can be used to describe the status of a printer: (1) hrDeviceStatus in the entry in the hrDeviceTable; (2) hrPrinterStatus in the hrPrinterTable; and (3) hrPrinterDetectedErrorState in the hrPrinterTable. These objects describe many of the states that a printer can be in. The following table shows how the values of the three printer-related objects in the Host Resources MIB relate to the states named above:

Printer Status	hrDeviceStatus	hrPrinterStatus	hrPrinterDetected-ErrorState
Idle	running(2)	idle(3)	none set
Busy/ Active	running(2)	printing(4)	
Non Critical Alert Active	warning(3)	idle(3) or printing(4)	could be: lowPaper, lowToner, or serviceRequested
Critical Alert Active	down(5)	other(1)	could be: jammed, noPaper, noToner, coverOpen, or serviceRequested
Unavailable	down(5)	other(1)	
Moving off-line	warning(3)	idle(3) or printing(4)	offline
Off-line	down(5)	other(1)	offline
Moving on-line	down(5)	warmup(5)	
Standby	running(2)	other(1)	

These named states are only a subset of the possible states - they are not an exhaustive list of the possible states. Nevertheless, several things should be noted. When using these states, it is not possible to detect when both critical and non-critical alerts are pending - if both are pending, the Critical Alert Active state will prevail. In addition, a printer in the Standby state will be represented in the Host Resources MIB with a device status of running(2) and a printer status of other(1), a set of states that don't uniquely distinguish this important printer state.

Detailed status per sub-unit is reported in the sub-unit status fields.

2.2.13.2.1 Host Resources MIB Printer Status

For completeness, the definitions of the Printer Status objects of the Host Resources MIB (RFC 2790 [28])are given below:

```
      hrDeviceStatus OBJECT-TYPE
          SYNTAX  INTEGER {
                     unknown(1),
                     running(2),
                     warning(3),
                     testing(4),
                     down(5)
                  }
          ACCESS  read-only
          STATUS  mandatory
          DESCRIPTION
           "The current operational state of the device
           described by this row of the table.  A value
           unknown(1) indicates that the current state of the
           device is unknown.  running(2) indicates that the
           device is up and running and that no unusual error
           conditions are known.  The warning(3) state
           indicates that agent has been informed of an
           unusual error condition by the operational software
           (e.g., a disk device driver) but that the device
           is still 'operational'.  An example would be high
           number of soft errors on a disk.  A value of
           testing(4), indicates that the device is not
           available for use because it is in the testing
           state.  The state of down(5) is used only when
           the agent has been informed that the device is
           not available for any use."
          ::= { hrDeviceEntry 5 }
```

```
      hrPrinterStatus OBJECT-TYPE
          SYNTAX INTEGER {
                    other(1),
                    unknown(2),
                    idle(3),
                    printing(4),
                    warmup(5)
                }
          ACCESS  read-only
          STATUS  mandatory
          DESCRIPTION
           "The current status of this printer device.  When in the
           idle(3), printing(4), or warmup(5) state, the corresponding
           hrDeviceStatus should be running(2) or warning(3).  When in
           the unknown(2) state, the corresponding hrDeviceStatus should
           be unknown(1)."
          ::= { hrPrinterEntry 1 }
```

```
      hrPrinterDetectedErrorState OBJECT-TYPE
          SYNTAX OCTET STRING (0..128)
          ACCESS read-only
          STATUS mandatory
          DESCRIPTION
           "This object represents any error conditions detected by the
           printer.  The error conditions are encoded as an OCTET STRING
           with the following definitions:

           Condition          Bit #

           lowPaper             0
           noPaper              1
           lowToner             2
           noToner              3
           doorOpen             4
           jammed               5
           offline              6
           serviceRequested     7

           inputTrayMissing     8
           outputTrayMissing    9
           markerSupplyMissing 10
           outputNearFull      11
           outputFull          12
           inputTrayEmpty      13
           overduePreventMaint 14

           Bit # 15 is not assigned.
           If multiple conditions are currently detected and the
           hrDeviceStatus would not otherwise be unknown(1) or
           testing(4), the hrDeviceStatus shall correspond to the worst
           state of those indicated, where down(5) is worse than
           warning(3), which is worse than running(2).

           Bits are numbered starting with the most significant bit of
           the first byte being bit 0, the least significant bit of the
           first byte being bit 7, the most significant bit of the
           second byte being bit 8, and so on.  A one bit encodes that
           the condition was detected, while a zero bit encodes that the
           condition was not detected.

           This object is useful for alerting an operator to specific
           warning or error conditions that may occur, especially those
           requiring human intervention."
```

::= { hrPrinterEntry 2 }

2.2.13.2.2 Sub-unit Status

Sub-unit status is reported in the entries of the principle table in the Group that represents the sub-unit. For sub-units that report a status, there is a status column in the table and the value of this column is always an integer formed in the following way.

The SubUnitStatus is an integer that is the sum of 5 distinct values, Availability, Non-Critical, Critical, On-line, and Transitioning. These values are:

Availability	value	
Available and Idle	0	000'b
Available and Standby	2	010'b
Available and Active	4	100'b
Available and Busy	6	110'b
Unavailable and OnRequest	1	001'b
Unavailable because Broken	3	011'b
Unknown	5	101'b

Non-Critical	
No Non-Critical Alerts	0
Non-Critical Alerts	8

Critical	
No Critical Alerts	0
Critical Alerts	16

On-Line	
State is On-Line	0
State is Off-Line	32

Transitioning	
At intended state	0
Transitioning to intended state	64

For example, an input (tray) that jammed on the next to the last page may show a status of 27 (unavailable because broken (3) + a critical

state (16), jammed, and a noncritical state (8), low paper).

2.2.13.3 Alert Tables

The Alert Group consists of a single table in which all active alerts are represented. This section provides an overview of the table and a description of how it is managed. The basic content of the alert table is the severity (critical or non-critical) of the alert, the Group and entry where a state change caused the alert, additional information about the alert (a more detailed location, an alert code, and a description), and an indication of the level of training needed to service the alert.

The Alert Table contains some information that is redundant, for example that an event has occurred, and some information that is only represented in the Alert Table, for example the additional information. A single table was used because a single entry in a group could cause more than one alert, for example paper jams in more than one place in a media path. Associating the additional information with the entry in the affected group would only allow one report where associating the additional information with the alert makes multiple reports possible. Every time an alert occurs in the printer, the printer makes one or more entries into the Alert Table. The printer determines if an event is to be classified as critical or non-critical. If the severity of the Alert is "critical", the printer sends a trap or event notification to the host indicating that the table has changed. Whether or not a trap is sent, the management application is expected to poll the printer on a regular basis and to read and parse the table to determine what conditions have changed, in order to provide reliable information to the management application user.

2.2.13.4 Alert Table Management

The alert tables are sparsely populated tables. This means the tables will only contain entries of the alerts that are currently active and the number of rows, or entries in the table will be dynamic. More than one event can be added or removed from the event tables at a time depending on the implementation of the printer.

There are basically two kinds of events that produce alerts: binary change events and unary change events. Binary change events come in pairs: the leading edge event and the trailing edge event. The leading edge event enters a state from which there is only one exit; for example, going from running to stopped with a paper jam. The only

exit from this state is fixing the paper jam and it is clear when that is accomplished. The trailing edge event exits the state that was entered by the leading edge event. In the example above, fixing the paper jam is the trailing edge event.

It is relatively straightforward to manage binary change events in the Alert Table. Only the leading edge event makes an entry in the alert table. This entry persists in the Alert Table until the trailing edge event occurs at which point this event is signaled by the removal of the leading edge event entry in the Alert Table. That is, a trailing edge event does not create an entry; it removes the corresponding leading edge event. Removing the leading edge entry may cause the unary change event "alertRemovalofBinaryChangeEntry" to be added to the table. With binary change events it is possible to compute the maximum number that can occur at the same time and construct an Alert Table that would hold that many events. There would be no possibility of table overflow and no information about outstanding events would be lost.

Unfortunately, there are some events that are not binary changes. This other category of event, the unary change event, is illustrated by the configuration change event. With this kind of event the state of the machine has changed, but to a state which is (often) just as valid as the state that was left and from which no return is necessary. For example, an operator may change the paper that is in the primary input source from letter to legal. At some time in the future the paper may be changed back to letter, but it might be changed to executive instead. This is where the problem occurs. It is not obvious how long to keep unary change event entries in the Alert Table. If they were never removed, the Alert Table would continue to grow indefinitely.

The agent needs to have an algorithm implemented for the management of the alert table, especially in the face of combinations of binary and unary alerts that would overflow the storage capacity of the table. When the table is full and new alerts need to be added, an old alert to be deleted should be chosen using the following rules:

1. Find a non-critical unary alert and delete it. If there are multiple non-critical unary alerts, it is suggested that the oldest one is chosen. If there are no non-critical unary alerts, then,

2. Find a non-critical binary alert and delete it. If there are multiple non-critical binary alerts, it is suggested that the oldest one is chosen. If there are no non-critical binary alerts, then,

3. Find a critical (binary) alert and delete it. If there are multiple critical alerts, it is suggested that the oldest one be chosen. Agent implementers are encouraged to provide at least enough storage space for the maximum number of critical alerts that could occur simultaneously. Note that all critical alerts are binary.

In the event that a critical binary alert has been deleted out of the alert table; when space allows and the alert condition still exists, the alert should be re-added to the alert table even if there was no subsequent transition into the associated state. It is recommended that this be done for non-critical binary alerts as well. Note that the new alert entry will not have the same index as the original entry that was moved out of the table.

Note that because the Alert Index is a monotonically increasing integer there will be gaps in the values in the table when an alert is deleted. The management application may want to re-acquire the Printer state and check for state changes that it did not observe in the Alert Table if such gaps are detected.

2.3 Read-Write Objects

Some objects in the printer MIB reflect the existence or amount of a given resource within the printer. Some examples of such resources are the size and number of sheets in a paper tray or the existence of certain output options. Some printers have automatic sensors for these resources. Most printers lack sensors for every property of every resource. The management application is allowed to write into objects that hold descriptive or existence values for printers that cannot sense these values. The ability to change the value of a read-write object may depend on the implementation of the agent. Many objects in the MIB are given read-write access, but a printer implementation might only permit a management application to change the value if the printer can not sense the value itself. Note that even though some objects explicitly state the behavior of conditional ability to change values, any read-write object may act this way.

Generally, an object is given read-write access in the Printer MIB specification if:

1. The object involves installation of a resource that some printers cannot themselves detect. Therefore, external means are needed to inform the printer of the installation. (Here external means include using the operator console, or remote management application) and

2. The printer will behave differently if the installation of the resource is reported than the printer would if the installation were not reported; that is, the object is not to be used as a place to put information not used by the printer, i.e., not a "sticky-note". Another way of saying this is that the printer believes that information given it and acts as if the information were true. For example, on a printer that cannot sense the size, if one paper size is loaded, but another size is set into the paper size object, then the printer will use the size that was set as its current paper size in its imaging and paper handling.

3. The printer may get hints that it may not know about the existence or properties of certain resources. For example, a paper tray may be removed and re-inserted. When this removal and insertion happens, the printer may either assume that a property, such as the size of paper in the tray, has not changed or the printer may change the value of the associated object to "unknown", as might be done for the amount of paper in the tray. As long as the printer acts according to the value in the object either strategy is acceptable.

4. It is an implementation-specific matter as to whether or not MIB object values are persistent across power cycles or cold starts. It is particularly important that the values of the prtMarkerLifeCount object persist throughout the lifetime of the printer. Therefore, if the value of any MIB object persists across power cycles, then the prtMarkerLifeCount object must also persist.

2.4 Enumerations

Enumerations (enums) are sets of symbolic values defined for use with one or more objects. Some common enumeration sets are assigned a symbolic data type name (textual convention). These enumerations are listed at the beginning of this specification.

2.4.1 Registering Additional Enumerated Values

This working group has defined several type of enumerations. These enumerations differ in the method employed to control the addition of new enumerations. Throughout this document, references to "enumeration (n)", where n can be 1, 2 or 3 can be found in the various tables. The definitions of these types of enumerations are:

enumeration (1) All the values are defined in the Printer MIB specification (RFC for the Printer MIB). Additional enumerated

values require a new RFC.

enumeration (2) An initial set of values are defined in the Printer MIB specification. Additional enumerated values are registered after review by this working group. The initial versions of the MIB will contain the values registered so far. After the MIB is approved, additional values will be registered through IANA after approval by this working group.

enumeration (3) An initial set of values are defined in the Printer MIB specification. Additional enumerated values are registered without working group review. The initial versions of the MIB will contain the values registered so far. After the MIB is approved, additional values will be registered through IANA without approval by this working group.

3. Groups from other MIB Specifications

This section identifies the groups from other MIBs that shall be supported to supplement and complete a printer MIB implementation. The section also describes some of the less obvious characteristics of the Printer MIB structure that are related to the inclusion of these other MIB groups.

3.1 System Group

All objects in the system group of MIB-II (RFC 1213 [14]) shall be implemented; however, as described in paragraph 2.4, implementers should carefully consider what constitutes the "system".

3.2 System Controller

The storage and device groups of the Host Resources MIB (RFC 2790 [28]) shall be implemented to support the printer(s) system controller, and any supporting devices. If deemed appropriate by the implementer, other groups of the Host Resources MIB (System, Running Software, Running Software Performance, and Installed Software) may be implemented.
Because of the structure of the Host Resources MIB, the devices constituting the system controller are at the same level as the printer.

3.3 Interface Group objects

All objects in the Interfaces Group of MIB-II (RFC 1213 [14]) shall

be implemented for all print information interfaces to the printer, including non-network interfaces.

3.3.1 Interface Types

The interfaces group of RFC 1213 [14] contains only a partial list of interface types that can be specified in the "ifType" object. For a complete list of interface types, refer to the IANA registry at "ftp://ftp.isi.edu/mib/ianaiftype.mib"

4. Differences from RFC 1759

This draft supercedes and replaces RFC 1759. However, a compliant implementation of RFC 1759 is also compliant with this draft. The following changes to RFC 1759 are included:

- Minor editorial corrections and changes. Updated the cover page and added the "SNMP Management Framework" boilerplate to section 1.

- Updated figure 2 to use MIB names instead of RFC numbers.

- Updated Coded Character Set description and IANA registration process.

- Change hrPrinterDetectedErrorState "coverOpen" (bit 4) to "doorOpen" per RFC 2790.

- Added second octet of hrPrinterDetectedErrorState as partially described and assigned in the updated Host Resources MIB (RFC 2790).

- Remove fixed association of hrDeviceStatus (warning/down) from hrPrinterDetetctedErrorState per RFC 2790.

- Instead of showing bit 15 as "not assigned" in the quote from RFC 2790 in the hrPrinterDetectedErrorState object, removed that from the tabular form and added it as a sentence, because the RFC doesn't show bit 15 in the tabular form.

- Clarified the international considerations.

- Added prtChannelInformation to the Channel Group textual-conventions on a per channel basis to clarify the channel description and enhance interoperability.

- Deprecated some obsolete channel types.

- Extended the Alert Table and PrtMarkerSuppliesSupplyUnit textual conventions to include values from the Finisher MIB.

- Clarified alerts based on unary vs. binary change events.

- Added (optional) unary change event alertRemovalOfBinaryChangeEntry(1801).

- Establish a convention for contact information for prtGeneralCurrentOperator and prtGeneralServicePerson.

- Added prtAuxiliarySheetStartupPage PresentOnOff

- Added prtAuxiliarySheetBannerPage PresentOnOff

- Added prtGeneralPrinterName OCTET STRING

- Added prtGeneralSerialNumber OCTET STRING

- Added prtInputNextIndex Integer32

- Added the Input Switching Group

- Added prtAlertCriticalEvents Counter32

- Added prtAlertAllEvents Counter32

- Updated PrtAlertCode enums including generic alert codes.

- Created five OBJECT-GROUPs (prtAuxilliarySheetGroup, prtInputSwitchingGroup, prtGeneralV2Group, prtAlertTableV2Group, prtChannelV2Group). Added the nine new objects to them (prtAuxiliarySheetStartupPage, prtAuxiliarySheetBannerPage, prtGeneralPrinterName, prtGeneralSerialNumber, prtAlertCriticalEvents, prtAlertAllEvents, prtInputMediaLoadTimeout, prtInputNextIndex, prtChannelInformation). Created one new NOTIFICATION-GROUP (prtAlertTrapGroup) to contain printerV2Alert. Included the new OBJECT-GROUPs and the NOTIFICATION_GROUP in prtMIBCompliance, all in GROUP (not MANDATORY-GROUP) clauses. The nine new objects are optional, i.e., this draft is backward compatible with RFC 1759.

- prtAlertTime is strongly recommended.

- Deprecated the use of alert codes doorOpen(501) and doorClosed(502), in favor of coverOpened(3) and coverClosed(4).

- Added the PrtConsoleDisableTC and PrtMarkerAddressabilityUnitTC textual conventions, and changed the PrtConsoleDisable and PrtMarkerAddressabilityUnit objects' syntax to use those TCs, and changed the PrtGeneralEntry and PrtMarkerColorantEntry SEQUENCEs to reflect the new syntax.

- Added textual conventions "LocalizedDescriptionStringTC" and "ConsoleDescriptionStringTC" and updated several objects to use them.

- Changed most enumerations to textual conventions and therefore changed the SYNTAX of many objects from RFC 1759 to specify the appropriate textual conventions. (28 TCs were added.)

- Changed the TC names "MediaUnit" to "PrtMediaUnitTC", "CapacityUnit" to "PrtCapacityUnitTC", and "SubUnitStatus" to "PrtSubUnitStatusTC"

- All objects with a MAX-ACCESS of read-write now have a MIN-ACCESS of read-only.

- Added 'IANA Considerations' and 'Internationalization Considerations' as top level sections, per IETF guidelines.

- Updated Security and Copyright sections.

- Updated references.

- Added Appendix E - Overall Printer Status Table.

- Updated participant and contact information.

5. The Printer MIB

```
Printer-MIB DEFINITIONS ::= BEGIN

IMPORTS
    MODULE-IDENTITY, OBJECT-TYPE, Counter32, Integer32, TimeTicks,
        NOTIFICATION-TYPE, OBJECT-IDENTITY, mib-2 FROM SNMPv2-SMI
    TEXTUAL-CONVENTION FROM SNMPv2-TC
    MODULE-COMPLIANCE, OBJECT-GROUP, NOTIFICATION-GROUP FROM SNMPv2-CONF
    hrDeviceIndex, hrStorageIndex FROM HOST-RESOURCES-MIB;
```

```

            State is Off-Line                   32    10 0000'b

        Transitioning

            At intended state                    0       0000'b
            Transitioning to intended state     64   100 0000'b"

    SYNTAX    INTEGER (0..126)

PresentOnOff ::= TEXTUAL-CONVENTION
    -- This is a type 1 enumeration.
```

```
    STATUS    current
    DESCRIPTION
        "Presence and configuration of a device or feature."
    SYNTAX    INTEGER {
                  other(1),
                  on(3),
                  off(4),
                  notPresent(5)
                  }

CodedCharSet ::= TEXTUAL-CONVENTION
    -- This is a type 3 enumeration.
    STATUS    current
    DESCRIPTION
        "A coded character set value that specifies both a set of
        characters that may be used and an encoding (as one or more
        octets) that is used to represent the characters in the set.
        These values are to be used to identify the encoding employed
        for strings in the MIB where this is not fixed by the MIB.

        Some objects that allow a choice of coded character set are: the
        prtLocalizationCharacterSet object in the LocalizationTable and
        prtInterpreterDefaultCharSetIn. The
        prtGeneralCurrentLocalization and prtConsoleLocalization objects
        in turn contain the index in the LocalizationTable of the
        current localization (country, language, and coded character
        set) of the 'description' objects and the console, respectively.

        The current list of character sets and their enumerated values
        used to reference them are contained in the IANA Character Set
        registry.  The enum value is indicated by the MIBenum entry in
        the registry.  The enum symbol is indicated by the Alias that
        starts with 'cs' for character set.

        The IANA character sets registry is [4].  To add a new character
        set to the IANA Registry, see RFC 2278 or BCP 19 [20].

        The textual conventions LocalizedDescriptionStringTC and
        ConsoleDescriptionStringTC are required for use with objects
        that are controlled by prtGeneralCurrentLocalization and
        prtConsoleLocalization, respectively."

    SYNTAX    INTEGER {
                  other(1)    -- used if the designated coded
                              -- character set is not currently
```

```

--
-- Alert Group Textual Conventions
--

PrtAlertSeverityLevelTC ::= TEXTUAL-CONVENTION
    -- This value is a type 1 enumeration.
    STATUS    current
    DESCRIPTION
        "The level of severity of this alert table entry.  The printer
        determines the severity level assigned to each entry in the
        table. A critical alert is binary by nature and definition. A
        warning is defined to be a non-critical alert. The original and
        most common warning is unary. The binary warning was added later
        and given a more distinguished name."
    SYNTAX    INTEGER {
                  other(1),
                  critical(3),
                  warning(4),
                  warningBinaryChangeEvent(5)
                  }

PrtAlertTrainingLevelTC ::= TEXTUAL-CONVENTION
    -- This value is a type 2 enumeration.
    STATUS    current
    DESCRIPTION
        "The level of training required to handle this alert, if human
        intervention is required. The noInterventionRequired value
        should be used if the event does not require any human
        intervention. The training level is an enumeration that is
        determined and assigned by the printer manufacturer based on the
        information or the training required to handle this alert.  The
```

```
        printer will break alerts into these different training levels.
        It is the responsibility of the management application in the
        system to determine how a particular alert is handled and how
        and to whom that alert is routed.  The following are the four
        training levels of alerts:

        Field Service - Alerts that typically require advanced
            training and technical knowledge of the printer and its sub
            units. An example of a technical person would be a
            manufacturer's Field Service representative, or other person
            formally trained by the manufacturer or similar
            representative.
        Trained - Alerts that require an intermediate or moderate level
            of knowledge of the printer and its sub-units. A typical
            examples of alerts that a trained operator can handle is
            replacing toner cartridges.
        Untrained -     Alerts that can be fixed without prior
            training either because the action to correct the alert is
            obvious or the printer can help the untrained person fix the
            problem. A typical example of such an alert is reloading
            paper trays and emptying output bins on a low end printer.
        Management -    Alerts that have to do with overall operation of
            and configuration of the printer. Examples of management
            events are configuration change of sub-units."
    SYNTAX    INTEGER {
                  other(1),
                  unknown(2),
                  untrained(3),

                  fieldService(5),
                  management(6),
                  noInterventionRequired(7)
                 }

PrtAlertGroupTC ::= TEXTUAL-CONVENTION
    -- This value is a type 1 enumeration for values in the range
    -- 1 to 29.
    -- Values of 30 and greater are for use in other MIBs that augment
    -- tables in the Printer MIB. Therefore, other MIBs may assign
    -- alert codes of 30 or higher to use the alert table from the
    -- Printer MIB without requiring revising and re-publishing this
    -- document.
    STATUS    current
    DESCRIPTION
        "The type of sub-unit within the printer model that this alert
```

```
        is related.  Input, output, and markers are examples of printer
        model groups, i.e., examples of types of sub-units. Wherever
        possible, these enumerations match the sub-identifier that
        identifies the relevant table in the printer MIB.

        NOTE: Alert type codes have been added for the host resources
        MIB storage table and device table. These additional types are
        for situations in which the printer's storage and device objects
        must generate alerts (and possibly traps for critical alerts)."

                  }

PrtAlertCodeTC ::= TEXTUAL-CONVENTION
    -- This value is a type 2 enumeration.
    STATUS    current
    DESCRIPTION
        "The code that describes the type of alert for this entry in the
        table. Binary change event alerts describe states of the subunit
        while unary change event alerts describe a single event. The
        same alert code can be used for a binary change event or a unary
        change event, depending on implementation. Also, the same alert
        code can be used to indicate a critical or a non-critical
```

(warning) alert, depending on implementation. The value of prtAlertSeverityLevel specifies binary vs. unary and critical vs. non-critical for each event for the implementation.

While there are some specific codes for many subunits, the generic codes should be used for most subunit alerts. The network management station can then query the subunit specified by prtAlertGroup to determine further subunit status and other subunit information.

An agent shall not add two entries to the alert table for the same event, one containing a generic event code and the other containing a specific event code; the agent shall add only one entry in the alert table for each event; either generic (preferred) or specific, not both.

Implementation of the unary change event alertRemovalOfBinaryChangeEntry(1801) is optional. When implemented, this alert code shall indicate to network management stations that the trailing edge of a binary change event has occurred and the corresponding alert entry has been removed from the alert table. As with all events, the alertRemovalOfBinaryChangeEntry(1801) alert shall be placed at the end of the alert table. Such an alert table entry shall specify the following information:

prtAlertSeverityLevel	warningUnaryChangeEvent(4)
prtAlertTrainingLevel	noInterventionRequired(7)
prtAlertGroup	alert(18)
prtAlertGroupIndex	the index of the row in the alert table of the binary change event that this event has removed.
prtAlertLocation	unknown (-2)
prtAlertCode	alertRemovalOfBinaryChangeEntry(1801)
prtAlertDescription	<description or null string>
prtAlertTime	the value of sysUpTime at the time of the removal of the binary change event from the alert table.

Optionally, the agent may generate a trap coincident with removing the binary change event and placing the unary change event alertRemovalOfBinaryChangeEntry(1801) in the alert table. For such a trap, the prtAlertIndex sent with the above trap

```
        parameters shall be the index of the
        alertRemovalOfBinaryChangeEvent row that was added to the
        prtAlertTable; not the index of the row that was removed from
        the prtAlertTable."
    SYNTAX    INTEGER {

        configuration change is defined to be an action that results in
        a change to any MIB object other than those that reflect status
        or level, or those that act as counters or gauges. In addition,
        any action that results in a row being added or deleted from any
        table in the Printer MIB is considered a configuration change.
        Such changes will often affect the capability of the printer to
        service certain types of print jobs. Management applications may
        cache infrequently changed configuration information about sub
        units within the printer. This object should be incremented
        whenever the agent wishes to notify management applications that
        any cached configuration information for this device is to be
        considered 'stale'. At this point, the management application
        should flush any configuration information cached about this
        device and fetch new configuration information.

        The following are examples of actions that would cause the
        prtGeneralConfigChanges object to be incremented:

        - Adding an output bin
        - Changing the media in a sensing input tray
        - Changing the value of prtInputMediaType

        Note that the prtGeneralConfigChanges counter would not be
        incremented when an input tray is temporarily removed to load
        additional paper or when the level of an input device changes."

-- The Input Switching Group
--
-- The input switching group allows the administrator to set the
-- input subunit time-out for the printer and to control the
-- automatic input subunit switching by the printer when an input
-- subunit becomes empty.
--
-- This group is optional. However, to claim conformance to this
-- group, it is required to implement every object in the group.

prtInputMediaLoadTimeout OBJECT-TYPE
   SYNTAX     Integer32
   MAX-ACCESS read-write
   STATUS     current
   DESCRIPTION
        "When the printer is not able to print due to a subunit being
        empty or the requested media must be manually loaded, the
        printer will wait for the duration (in seconds) specified by
        this object. Upon expiration of the time-out, the printer will
        take the action specified by prtInputNextIndex.

        The event which causes the printer to enter the waiting state is
        product specific. If the printer is not waiting for manually fed
        media, it may switch from an empty subunit to a different
        subunit without waiting for the time-out to expire.

        A value of (-1) implies 'other' or 'infinite' which translates
        to 'wait forever'. The action which causes printing to continue
        is product specific. A value of (-2) implies 'unknown'."
   ::= { prtInputEntry 24 }
```

```
prtInputNextIndex OBJECT-TYPE
   SYNTAX     Integer32
   MAX-ACCESS read-write
   STATUS     current
   DESCRIPTION
        "The value of prtInputIndex corresponding to the input subunit
        which will be used when this input subunit is emptied and the
        time-out specified by prtInputMediaLoadTimeout expires. A value
        of zero(0) indicates that auto input switching will not occur
        when this input subunit is emptied. If the time-out specified by
        prtInputLoadMediaTimeout expires and this value is zero(0), the
        job will be aborted. A value of (-1) means other. The value (-2)
        means 'unknown' and specifically indicates that an
        implementation specific method will determine the next input
        subunit to use at the time this subunit is emptied and the time
        out expires. The value(-3) means input switching is not
        supported for this subunit."
   ::= { prtInputEntry 25 }

-- The Marker Group
--
-- A marker is the mechanism that produces marks on the print
-- media. The marker sub-units and their associated supplies are
-- represented by the Marker Group in the model.  A printer can
-- contain one or more marking mechanisms.  Some examples of
-- multiple marker sub-units are: a printer
-- with separate markers for normal and magnetic ink or an
-- imagesetter that can output to both a proofing device and
-- final film. Each marking device can have its own set of
-- characteristics associated with it, such as marking technology
-- and resolution.
--
-- Implementation of every object in this group is mandatory.

prtMarker OBJECT IDENTIFIER ::= { printmib 10 }

-- The printable area margins as listed below define an area of
-- the print media which is guaranteed to be printable for all
-- combinations of input, media paths, and interpreters for this
-- marker.

-- The Print Job Delivery Channel Group
--
-- Implementation of every object in this group is mandatory except for
```

```
-- prtChannelInformation.
--
-- Print Job Delivery Channels are independent sources of print
-- data. Here, print data is the term used for the information
-- that is used to construct printed pages and may have both data
-- and control aspects. The output of a channel is in a form
-- suitable for input to one of the interpreters as a
-- stream. A channel may be independently enabled (allowing
-- print data to flow) or disabled (stopping the flow of
-- print data). A printer may have one or more channels.
--
-- The Print Job Delivery Channel table describes the
-- capabilities of the printer and not what is currently being
-- performed by the printer
--
-- Basically, the print job delivery channel abstraction
-- describes the final processing step of getting the print data
-- to an interpreter. It might include some level of
-- decompression or decoding of print stream data.
-- channel. All of these aspects are hidden in the channel
-- abstraction.
--
-- There are many kinds of print job delivery channels; some of
-- which are based on networks and others which are not. For
-- example, a channel can be a serial (or parallel) connection;
-- it can be a service, such as the UNIX Line Printer Daemon
-- (LPD), offering services over a network connection; or
-- it could be a disk drive into which a floppy disk with
-- the print data is inserted. Each print job delivery channel is
-- identified by the electronic path and/or service protocol
-- used to deliver print data to a print data interpreter.
--
-- Channel example                   Implementation
--
-- serial port channel            bi-directional data channel
-- parallel port channel          often uni-directional channel
-- IEEE 1284 port channel         bi-directional channel
-- SCSI port channel              bi-directional
-- Apple PAP channel              may be based on LocalTalk,
--                                Ethernet or Tokentalk
-- LPD Server channel             TCP/IP based, port 515
-- Netware Remote Printer         SPX/IPX based channel
-- Netware Print Server           SPX/IPX based channel
--
-- It is easy to note that this is a mixed bag.  There are
```

```
-- some physical connections over which no (or very meager)
-- protocols are run (e.g. the serial or old parallel ports)
-- and there are services which often have elaborate
-- protocols that run over a number of protocol stacks. In
-- the end, what is important is the delivery of print data
-- through the channel.
--
-- The print job delivery channel sub-units are represented by
-- the Print Job Delivery Channel Group in the Model. It has a
-- current print job control language, which can be used to
-- specify which interpreter is to be used for the print data and
-- to query and change environment variables used by the
-- interpreters (and Management Applications). There is also a
-- default interpreter that is to be used if an interpreter is
-- not explicitly specified using the Control Language.

-- The first seven items in the Print Job Delivery Channel Table
-- define the "channel" itself.  A channel typically depends on
-- other protocols and interfaces to provide the data that flows
-- through the channel.
--
-- Control of a print job delivery channel is largely limited to
-- enabling or disabling the entire channel itself. It is likely
-- that more control of the process of accessing print data
-- will be needed over time. Thus, the ChannelType will
-- allow type-specific data to be associated with each
-- channel (using ChannelType specific groups in a fashion
-- analogous to the media specific MIBs that are associated
-- with the IANAIfType in the Interfaces Table). As a first
-- step in this direction, each channel will identify the
-- underlying Interface on which it is based. This is the
-- eighth object in each row of the table.

-- The Print Job Delivery Channel Table
--
-- The prtChannelTable represents the set of input data sources
-- which can provide print data to one or more of the
-- interpreters available on a printer

prtChannelInformation OBJECT-TYPE
    SYNTAX     OCTET STRING (SIZE (0..255))
    MAX-ACCESS read-only
    STATUS     current
    DESCRIPTION
        "Auxiliary information to allow a printing application to use
        the channel for data submission to the printer.  An application
        capable of using a specific PrtChannelType should be able to use
        the combined information from the prtChannelInformation and
        other channel and interface group objects to 'bootstrap' its use
        of the channel.  prtChannelInformation is not intended to
        provide a general channel description, nor to provide
        information that is available once the channel is in use.

        The encoding and interpretation of the prtChannelInformation
        object is specific to channel type.  The description of each
```

PrtChannelType enum value for which prtChannelInformation is defined specifies the appropriate encoding and interpretation, including interaction with other objects. For channel types that do not specify a prtChannelInformation value, its value shall be null (0 length).

When a new PrtChannelType enumeration value is registered, its accompanying description must specify the encoding and interpretation of the prtChannelInformation value for the channel type. prtChannelInformation semantics for an existing PrtChannelType may be added or amended in the same manner as described in section 2.4.1 for type 2 enumeration values.

The prtChannelInformation specifies values for a collection of channel attributes, represented as text according to the following rules:

1. The prtChannelInformation is not affected by localization.

2. The prtChannelInformation is a list of entries representing the attribute values. Each entry consists of the following items, in order:

a. A keyword, composed of alphabetic characters (A-Z, a-z) represented by their NVT ASCII [10] codes, that identifies a channel attribute,

b. The NVT ASCII code for an Equals Sign (=) (code 61) to delimit the keyword,

c. A data value encoded using rules specific to the PrtChannelType to with the prtChannelInformation applies which must in no case allow an octet with value 10 (the NVT ASCII Line Feed code),

d. the NVT ASCII code for a Line Feed character (code 10) to delimit the data value.

No other octets shall be present.

Keywords are case-sensitive. Conventionally, keywords are capitalized (including each word of a multi-word keyword) and since they occupy space in the prtChannelInformation, they are kept short.

3. If a channel attribute has multiple values, it is represented by multiple entries with the same keyword, each specifying one value. Otherwise, there shall be at most one entry for each attribute.

4. By default, entries may appear in any order. If there are ordering constraints for particular entries, these must be specified in their definitions.

5. The prtChannelInformation value by default consists of text represented by NVT ASCII graphics character codes. However, other representations may be specified:

a. In cases where the prtChannelInformation value contains information not normally coded in textual form, whatever symbolic representation is conventionally used for the information should be used for encoding the prtChannelInformation value. (For instance, a binary port value might be represented as a decimal number using NVT ASCII codes.) Such encoding must be specified in the definition of the value.

b. The value may contain textual information in a character set other than NVT ASCII graphics characters. (For instance, an identifier might consist of ISO 10646 text encoded using the UTF-8 encoding scheme.) Such a character set and its encoding must be specified in the definition of the value.

6. For each PrtChannelType for which prtChannelInformation entries are defined, the descriptive text associated with the PrtChannelType enumeration value shall specify the following information for each entry:

Title: Brief description phrase, e.g.: 'Port name', 'Service Name', etc.

Keyword: The keyword value, e.g.: 'Port' or 'Service'

Syntax: The encoding of the entry value if it cannot be directly represented by NVT ASCII.

Status: 'Mandatory', 'Optional', or 'Conditionally Mandatory'

Multiplicity: 'Single' or 'Multiple' to indicate whether the entry may be present multiple times.

```
        Description:  Description of the use of the entry, other
                      information required to complete the definition
                      (e.g.: ordering constraints, interactions between
                      entries).

        Applications that interpret prtChannelInformation should ignore
        unrecognized entries, so they are not affected if new entry
        types are added."

-- The Alerts Group
--
-- The prtAlertTable lists all the critical and non-critical
-- alerts currently active in the printer.  A critical alert is
-- one that stops the printer from printing immediately and
-- printing can not continue until the critical alert condition
-- is eliminated.  Non-critical alerts are those items that do
-- not stop printing but may at some future time.
-- The table contains information on the severity, component,
-- detail location within the component, alert code and
-- description of each critical alert that is currently active
-- within the printer.  See 2.2.13 for a more complete
-- description of the alerts table and its management.
--
-- Each parameter in the Trap PDU is a full OID which itself is
-- indexed by the host resources MIB "hrDeviceIndex" object. In
-- order for a management station to obtain the correct
-- "hrDeviceIndex" associated with a particular Trap PDU, the
-- "hrDeviceIndex" value can be extracted from the returned OID
-- value in the Trap PDU when the PDU is received by the
-- Management station.
--
-- Implementation of every object in this group is mandatory.

    }

prtAlertIndex OBJECT-TYPE
    SYNTAX     Integer32 (1..2147483647)
    MAX-ACCESS not-accessible
    STATUS     current
    DESCRIPTION
        "The index value used to determine which alerts have been added
        or removed from the alert table. This is an incrementing integer
        initialized to 1 when the printer is reset. (i.e. The first
        event placed in the alert table after a reset of the printer
        shall have an index value of 1.)  When the printer adds an alert
        to the table, that alert is assigned the next higher integer
        value from the last item entered into the table.  If the index
        value reaches its maximum value, the next index value used must
        be 1.

        NOTE: The management application will read the alert table when
        a trap or event notification occurs or at a periodic rate and
        then parse the table to determine if any new entries were added
        by comparing the last known index value with the current highest
        index value. The management application will then update its
        copy of the alert table.  When the printer discovers that an
        alert is no longer active, the printer shall remove the row for
        that alert from the table and shall reduce the number of rows in
        the table.  The printer may add or delete any number of rows
        from the table at any time.  The management station can detect
        when binary change alerts have been deleted by requesting an
        attribute of each alert, and noting alerts as deleted when that
        retrieval is not possible.  The objects 'prtAlertCriticalEvents'
```

```
        and 'prtAlertAllEvents' in the 'prtGeneralTable' reduce the
        need for management applications to scan the 'prtAlertTable'."

6. IANA Considerations

See section 2.4.1, 'Registering Additional Enumerated Values'.

7. Internationalization Considerations

See section 2.2.1.1, 'International Considerations'.

8. Security Considerations

The Printer MIB specifies a database and not necessarily a protocol for accessing the database. With regards to the security of the information within the database, it is anticipated that the primary vehicle for accessing this data will be through the use of the Simple Network Protocol (SNMP). There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-write. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

SNMPv1 by itself is not a secure environment. Even if the network is secure (for example by using IPSec), there is no control as to who on the secure network is allowed to access and GET/SET (read/change) the objects in this MIB.

It is recommended that implementers consider the security features provided by the SNMPv3 framework. Specifically, the use of the User-based Security Model (RFC 2574 [25]) and the View-based Access Control Model (RFC 2575 [26]) is recommended.

It is then a customer/user responsibility to ensure that the SNMP entity giving access to an instance of this MIB, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET them.

Where the operational capability of the printing device are especially vulnerable or difficult to administer, certain objects within this MIB have been tagged as READ-ONLY, preventing modification. Further, for all READ-WRITE objects within the MIB, the working group has included specific conformance guidelines stating that vendors are free to implement these objects as READ-ONLY. This conformance allowance should cover cases where specific vendor vulnerabilities may differ from product to product. (See conformance section with regards to MIN-ACCESS clauses).

Appendix A - Glossary of Terms

Addressability - On the marker, the number of distinct marking units (pels) per unit of addressability unit that can be set; for example, 300 dots per inch is expressed as 300 per 1000 Thousandths Of Inches and 4 dots per millimeter is 4 per 1000 Micrometers. Addressability is not resolution because marks that are one addressability position apart may not be independently resolvable by the eye due to factors such as gain in the area of marks so they overlap or nearly touch.

Alert - A reportable event for which there is an entry in the alert table.

Bin - An output sub-unit which may or may not be removable.

Binary Change Event - An event which comes in pairs; the leading edge event and the trailing edge event. The leading edge event enters a state from which there is only one exit. A binary change event may be critical or non-critical. See unary change event.

Bursting - The process by which continuous media is separated into individual sheets, typically by bursting along pre-formed perforations.

Channel - A term used to describe a single source of data which is presented to a printer. The model that we use in describing a printer allows for an arbitrary number of channels. Multiple channels can exist on the same physical port. This is commonly done over Ethernet ports where EtherTalk, TCP/IP, and SPX/IPX protocols can be supplying different data streams simultaneously to a single printer on the same physical port.

Collation - In multiple copy output, placing the pages from separate copies into separate ordered sets, ready for binding.

Control Language - A data syntax or language for controlling the printer through the print data channel.

Critical Alert - An alert triggered by an event which leads to a state in which printing is no longer possible; the printer is stopped.

Decollating - The process by which the individual parts within a multi-part form are separated and sorted into separate stacks for each part.

Description - Information about the configuration and capabilities of the printer and its various sub-units.

DPA - ISO 10175 Document Printing Application standard. A standard for a client server protocol for a print system, including (1) submitting print jobs to and (2) managing print jobs in a spooler.

Event - A state change in the printer.

Group - A collection of objects that represent a type of sub-unit of the printer.

Host Resources MIB - See RFC 2790 [28].

IANA - Internet Assigned Numbers Authority. See STD 2, RFC 1700 [15].

Idempotent - Idempotence is the property of an operation that results in the same state no matter how many times it is executed (at least once). This is a property that is shared by true databases in which operations on data items only change the state of the data item and do not have other side effects. Because the SNMP data model is that of operations on a database, SNMP MIB objects should be assumed to be idempotent. If a MIB object is defined in a non-idempotent way, the this data model can break in subtle ways when faced with packet loss, multiple managers, and other common conditions.

> In order to fulfill the common need for actions to result from SNMP Set operations, SNMP MIB objects can be modeled such that the change in state from one state to another has the side effect of causing an action. It is important to note that with this model, an SNMP operation that sets a value equal to its current value will cause no action. This retains the idempotence of a single command, while allowing actions to be initiated by SNMP SET requests.

Input - A tray or bin from which instances of the media are obtained and fed into the Media Path.

Interpreter - The embodiment of an algorithm that processes a data stream consisting of a Page Description Language (PDL) and/or a Control Language.

Localization - The specification of human language, country, and

character set needed to present information to people in their native languages.

Management Application (a.k.a. Manager) - A program which queries and controls one or more managed nodes.

Management Station - A physical computer on which one or more management applications can run.

Media Path - The mechanisms that transport instances of the media from an input, through the marker, possibly through media buffers and duplex pathways, out to the output with optional finishing applied. The inputs and outputs are not part of the Media Path.

Non-critical Alert - An alert triggered by a reportable event which does not lead to a state in which printing is no longer possible; such an alert may lead to a state from which printing may no longer be possible in the future, such as the low toner state or the alert may be pure informational, such as a configuration change at the printer.

Output - A bin or stacker which accepts instances of media that have been processed by a printer.

Page Description Language (PDL) - A data syntax or language for the electronic representation of a document as a sequence of page images.

Printer - A physical device that takes media from an input source, produces marks on that media according to some page description or page control language and puts the result in some output destination, possibly with finishing applied.

Printing - The entire process of producing a printed document from generation of the file to be printed, choosing printing properties, selection of a printer, routing, queuing, resource management, scheduling, and finally printing including notifying the user.

Reportable event - An event that is deemed of interest to a management station watching the printer.

Status - Information regarding the current operating state of the printer and its various sub-units. This is an abstraction of the exact physical condition of the printer.

Sub-mechanism - A distinguishable part of a sub-unit.

Sub-unit - A part of the printer which may be a physical part, such as one of the input sources or a logical part such as an interpreter.

Tray - An input sub-unit which is typically removable.

Unary Change Event - An event that indicates a change of state of the printer, but to a state which is (often) just as valid as the state that was left, and from which no return is necessary. See binary change event.

Visible state - The portion of the state of the printer that can be examined by a management application.

Warning - A non-critical alert. See non-critical alert.

Appendix B - Media Size Names from ISO/IEC 10175 Document Printing Architecture

For the convenience of management application developers, this appendix lists the standardized media size names from ISO/IEC 10175 Document Printing Application (DPA), [7]. Management applications that present a dialogue for choosing or displaying media size are encouraged to present relevant names from this list to avoid requiring the user to remember the physical dimensions used to describe the size of the media. A printer implementing the Printer MIB has no knowledge of these names, however; all media sizes in the MIB are given in terms of media dimensions as the values of prtMediaDimFeedDir and prtInputChosenMediaDimXFeedDir.

String name	Description
other	
unknown	
na-letter or letter	North American letter size: 8.5 by 11 inches
na-legal or legal	North American legal size: 8.5 by 14 inches

jis-b10	JIS B10 size 32 mm by 45 mm

Appendix C - Media Names

For the convenience of management application developers, this appendix lists the standardized media names from ISO/IEC 10175 Document Printing Application (DPA), [7]. Management applications that present a dialogue for choosing media may wish to use these names as an alternative to separately specifying, size, color, and/or type. Using standard media names will mean that a single management application dealing with printers from different vendors and under different system mangers will tend to use the same names for the same media. If selection of media by name is used, the attributes (size, type or color) implied by the name must be explicitly mapped to the appropriate object (prtInputDeclared-MediaDimFeedDir, prtInputDeclaredMediaDimXFeedDir, prtInputMediaType and prtInputMediaColor) in the MIB. The object prtInputMediaName is intended for display to an operator and is purely descriptive. The value in prtInputMediaName is not interpreted by the printer so using a standard name for this value will not change any of the other media attributes nor will it cause an alert if the media in the input sub-unit does not match the name.

Simple Name	Descriptor Text
other	
unknown	
iso-a4-white	Specifies the ISO A4 white medium with size: 210 mm by 297 mm as defined in ISO 216
iso-a4-coloured	Specifies the ISO A4 colored medium with size: 210 mm by 297 mm as defined in ISO 216
iso-a4-transparent	Specifies the ISO A4 transparent medium with size: 210 mm by 297 mm as defined in ISO 216
iso-a3-white	Specifies the ISO A3 white medium with size: 297 mm by 420 mm as defined in ISO 216
iso-a3-coloured	Specifies the ISO A3 colored medium with size: 297 mm by 420 mm as defined in ISO 216
iso-a5-white	Specifies the ISO A5 white medium with size: 148 mm by 210 mm as defined in ISO 216
iso-a5-coloured	Specifies the ISO A5 colored medium with size: 148 mm by 210 mm as defined in ISO 216
iso-b4-white	Specifies the ISO B4 white medium with size: 250 mm by 353 mm as defined in ISO 216
iso-b4-coloured	Specifies the ISO B4 colored medium with size: 250 mm by 353 mm as defined in ISO 216
iso-b5-white	Specifies the ISO B5 white medium with size: 176 mm by 250 mm as defined in ISO 216

iso-b5-coloured	Specifies the ISO B5 colored medium with size: 176 mm by 250 mm as defined in ISO 216
jis-b4-white	Specifies the JIS B4 white medium with size: 257 mm by 364 mm as defined in JIS P0138
jis-b4-coloured	Specifies the JIS B4 colored medium with size: 257 mm by 364 mm as defined in JIS P0138
jis-b5-white	Specifies the JIS B5 white medium with size: 182 mm by 257 mm as defined in JIS P0138
jis-b5-coloured	Specifies the JIS B5 colored medium with size: 182 mm by 257 mm as defined in JIS P0138

The following standard values are defined for North American media:

na-letter-white	Specifies the North American letter white medium with size: 8.5 inches by 11 inches
na-letter-coloured	Specifies the North American letter colored medium with size: 8.5 inches by 11 inches
na-letter-transparent	Specifies the North American letter transparent medium with size: 8.5 inches by 11 inches
na-legal-white	Specifies the North American legal white medium with size: 8.5 inches by 14 inches
na-legal-coloured	Specifies the North American legal colored medium with size: 8.5 inches by 14 inches

The following standard values are defined for envelopes:

iso-b5-envelope	Specifies the ISO B5 envelope medium with size: 176 mm by 250 mm as defined in ISO 216 and ISO 269
iso-b4-envelope	Specifies the ISO B4 envelope medium with size: 250 mm by 353 mm as defined in ISO 216
iso-c4-envelope	Specifies the ISO C4 envelope medium with size: 229 mm by 324 mm as defined in ISO 216 and ISO 269
iso-c5-envelope	Specifies the ISO C5 envelope medium with size: 162 mm by 229 mm as defined in ISO 269
iso-designated-long-envelope	Specifies the ISO Designated Long envelope medium with size: 110 mm by 220 mm as defined in ISO 269

na-10x13-envelope	Specifies the North American 10x13 envelope medium with size: 10 inches by 13 inches
na-9x12-envelope	Specifies the North American 9x12 envelope medium with size: 9 inches by 12 inches
na-number-10-envelope	Specifies the North American number 10 business envelope medium with size: 4.125 inches by 9.5 inches
na-7x9-envelope	Specifies the North American 7x9 inch envelope
na-9x11-envelope	Specifies the North American 9x11 inch envelope
na-10x14-envelope	Specifies the North American 10x14 inch envelope
na-number-9-envelope	Specifies the North American number 9 business envelope 3.875 by 8.875 inches
na-6x9-envelope	Specifies the North American 6x9 inch envelope
na-10x15-envelope	Specifies the North American 10x15 inch envelope

The following standard values are defined for the less commonly used media (white-only):

iso-a0-white	Specifies the ISO A0 white medium with size: 841 mm by 1189 mm as defined in ISO 216
iso-a1-white	Specifies the ISO A1 white medium with size: 594 mm by 841 mm as defined in ISO 216
iso-a2-white	Specifies the ISO A2 white medium with size: 420 mm by 594 mm as defined in ISO 216
iso-a6-white	Specifies the ISO A6 white medium with size: 105 mm by 148 mm as defined in ISO 216
iso-a7-white	Specifies the ISO A7 white medium with size: 74 mm by 105 mm as defined in ISO 216
iso-a8-white	Specifies the ISO A8 white medium with size: 52 mm by 74 mm as defined in ISO 216
iso-a9-white	Specifies the ISO A9 white medium with size: 39 mm by 52 mm as defined in ISO 216

```
   iso-a10-white  Specifies the ISO A10 white medium
                    with size:  26 mm by 37 mm
                    as defined in ISO 216
   iso-b0-white  Specifies the ISO B0 white medium
                    with size: 1000 mm by 1414 mm
                    as defined in ISO 216
   iso-b1-white  Specifies the ISO B1 white medium
                    with size:  707 mm by 1000 mm
                    as defined in ISO 216
   iso-b2-white  Specifies the ISO B2 white medium
                    with size:  500 mm by 707 mm
                    as defined in ISO 216
   iso-b3-white  Specifies the ISO B3 white medium
                    with size:  353 mm by 500 mm
                    as defined in ISO 216
   iso-b6-white  Specifies the ISO B6 white medium
                    with size:  125 mm by 176 mm i
                    as defined in ISO 216
   iso-b7-white  Specifies the ISO B7 white medium
                    with size:  88 mm by 125 mm
                    as defined in ISO 216
   iso-b8-white  Specifies the ISO B8 white medium
                    with size:  62 mm by 88 mm
                    as defined in ISO 216
   iso-b9-white  Specifies the ISO B9 white medium
                    with size:  44 mm by 62 mm
                    as defined in ISO 216
   iso-b10-white Specifies the ISO B10 white medium
                    with size:  31 mm by 44 mm
                    as defined in ISO 216
   jis-b0-white  Specifies the JIS B0 white medium with size:
                    1030 mm by 1456 mm
   jis-b1-white  Specifies the JIS B1 white medium with size:
                    728 mm by 1030 mm
   jis-b2-white  Specifies the JIS B2 white medium with size:
                    515 mm by 728 mm
   jis-b3-white  Specifies the JIS B3 white medium with size:
                    364 mm by 515 mm
   jis-b6-white  Specifies the JIS B6 white medium with size:
                    257 mm by 364 mm
   jis-b7-white  Specifies the JIS B7 white medium with size:
                    182 mm by 257 mm
   jis-b8-white  Specifies the JIS B8 white medium with size:
                    128 mm by 182 mm
   jis-b9-white  Specifies the JIS B9 white medium with size:
```

91 mm by 128 mm
jis-b10-white Specifies the JIS B10 white medium with size:
64 mm by 91 mm

The following standard values are defined for engineering media:

a Specifies the engineering A size medium with size: 8.5 inches by 11 inches

b Specifies the engineering B size medium with size: 11 inches by 17 inches

c Specifies the engineering C size medium with size: 17 inches by 22 inches

d Specifies the engineering D size medium with size: 22 inches by 34 inches

e Specifies the engineering E size medium with size: 34 inches by 44 inches

Appendix D - Roles of Users

Background

The need for "Role Models" stemmed in large part from the need to understand the importance of any given proposed object for the MIB. Many times the real world need for a proposed object would be debated within the group; the debate would typically result in the need to describe the potential usage of the object in terms of a "live" person performing some type of printing-related task.

Determining the value of a proposed object through identification of the associated human users was found to be so common that a more formalized model was required for consistent analysis. The model describing categories of human-oriented tasks is called "Role Models" in this document.

In developing the Role Models it was necessary to identify the common, primary tasks that humans typically face when interacting with a printer and its related printing system(s). It was expected that certain kinds of tasks would serve to identify the various Role Models.

In presenting the set of Role Models, the set of "Common Print System Tasks" are first presented, followed by the set of Role Model definitions. Finally, a simple matrix is presented in which Role Models and Tasks are cross-compared.

Common Print System Tasks

Upon researching the many tasks encountered by humans in dealing with printers and printing systems, the following were found to be pervasive within any operating environment:

Printer job state - Determine the status of a job without a printer.

Printer capabilities - Determine the current capabilities of a printer, for example, the available media sizes, two-sided printing, a particular type of interpreter, etc.

Printer job submission - Submit a print job to a printer.

Printer job removal - Remove a job from a printer.

Notification of events - Receive notification of the existence of a

defined printer event. An event can be of many types, including warnings, errors, job stage completion (e.g., "job done"), etc.

Printer configuration - Query the current configuration of a printer.

Printer consumables - Determine the current state of any and all consumables within a printer.

Print job identification - Determine the identification of a job within a printer.

Internal printer status - Determine the current status of the printer.

Printer identification - Determine the identity of a printer.
Printer location - Determine the physical location of a printer.

Local system configuration - Determine various aspects of the current configuration of the local system involved with the operation of a printer.

These "tasks" cover a large spectrum of requirements surrounding the operation of a printer in a network environment. This list serves as the basis for defining the various Role Models described below.

Proposed Role Models

Following is the list of "Role Models" used to evaluate the requirements for any given Printer MIB object. Note that the keyword enclosed in parentheses represents an abbreviation for the particular Role Model in the matrix described later in this document.

User (USER) - A person or application that submits print jobs to the printer; typically viewed as the "end user" within the overall printing environment.

Operator (OP) - A person responsible for maintaining a printer on a day-to-day basis, including such tasks as filling empty media trays, emptying full output trays, replacing toner cartridges, clearing simple paper jams, etc.

Technician (TECH) - A person responsible for repairing a malfunctioning printer, performing routine preventive maintenance, and other tasks that typically require advanced training on the printer internals. An example of a "technician" would be a

manufacturer's Field Service representative, or other person formally trained by the manufacturer or similar representative.

System Manager (MGR) - A person responsible for configuration and troubleshooting of components involved in the overall printing environment, including printers, print queues and network connectivity issues. This person is typically responsible for ensuring the overall operational integrity of the print system components, and is typically viewed as the central point of coordination among all other Role Models.

Help Desk (HELP) - A person responsible for supporting Users in their printing needs, including training Users and troubleshooting Users' printing problems.

Asset Manager (AM) - A person responsible for managing an organization's printing system assets (primarily printers). Such a person needs to be able to identify and track the location of printing assets on an ongoing basis.

Capacity Planner (CP) - A person responsible for tracking the usage of printing resources on an ongoing basis for the purpose of planning printer acquisitions and/or placement of printers based on usage trends.

Installer (INST) - A person or application responsible for installing or configuring printing system components on a local system.

Accountant (ACCT) - A person responsible for tracking the usage of printing resources on an ongoing basis for the purpose of charging Users for resources used.

Matrix of Common Print System Tasks and Role Models

To better understand the relationship between the set of defined "Common Print System Tasks" and the various "Role Models," the following matrix is provided.

It is important to recognize that many of the tasks will appear to be applicable to many of the Role Models. However, when considering the actual context of a task, it is very important to realize that often the actual context of a task is such that the Role Model can change.

For example, it is obvious that a "System Manager" must be able to

submit print jobs to a printer; however, when submitting a print job, a person identified as a "System Manager" is actually operating in the context of a "User" in this case; hence, the requirement to submit a print job is not listed as a requirement for a System Manager.

Conversely, while a "User" must be able to remove a job previously submitted to a printer, an "Operator" is often expected to be able to remove any print job from any printer; hence, print job removal is a (subtly different) requirement for both the "User" and "Operator" Role Models.

	Role Models								
Requirement Area	USER	OP	TECH	MGR	HELP	AM	CP	INST	ACCT
Print job status	xx	xx	xx	xx	xx				
Printer capabilities	xx			xx	xx				
Print job submission	xx								
Print job removal	xx	xx							
Notification of events		xx	xx						
Printer configuration				xx				xx	
Printer consumables		xx					xx	xx	
Print job identification		xx		xx	xx		xx		xx
Internal printer status		xx	xx	xx					
Printer identification		xx	xx	xx	xx	xx	xx	xx	
Printer location							xx		
Local system configuration				xx				xx	

Appendix E - Overall Printer Status Table

The Status Table establishes a convention for the top 25 printer errors. The table defines a suggested relationship between various printer states and the variables Printer hrDeviceStatus, hrPrinterStatus, hrPrinterDetectedErrorState, prtAlertGroup, prtAlertCode and various sub-unit status variables (prtInputStatus, prtOutputStatus, prtMarkerStatus, prtMediaPathStatus and prtChannelStatus). This table is the recommended implementation of these variables. It is provided to guide implementors of this MIB and users of the MIB by providing a sample set of states and the variable values that are expected to be produced as result of that state. This information supplements that provided in Section 2.2.13.2 "Overall Printer Status". This is not an exhaustive list rather it is a guideline.

The definition of PrtSubUnitStatusTC specifies that SubUnitStatus is an integer that is the sum of 5 distinct values/states: Availability, Critical, Non-Critical, On-line and Transitioning.
Thus when a non-critical alert or alerts are present the values for Availability, On-Line and Transitioning will be summed with the Non-Critical Alerts (8) value.

The table was generated in landscape format and is located at ftp://ftp.pwg.org/pub/pwg/pmp/contributions/Top25Errors.pdf.

Appendix F . Participants

The following people attended at least one meeting of the Printer Working Group; many attended most meetings.

Ron Bergman - Hitachi Koki
Luis Cubero - Hewlett-Packard
Jay Cummings - Novell
Andy Davidson - Tektronix
Lee Farrell - Canon
Joel Gyllenskog - Microworks
Tom Hastings - Xerox
Scott Isaacson - Novell
Binnur Al-Kazily - Hewlett-Packard
Rick Landau - Digital Equipment Corporation
David Kellerman - Northlake Software
Harry Lewis - IBM
Pete Loya - Hewlett-Packard
Jay Martin . Underscore, Inc.
Bob Pentecost - Hewlett-Packard
Dave Roach - Unisys
Stuart Rowley - Kyocera
Bob Setterbo - Adobe
Ron Smith - Texas Instruments
Mike Timperman - Lexmark
Randy Turner - 2Wire, Inc.
Bill Wagner - NETsilicon, Inc.
Chris Wellens - Interworking Labs
Craig Whittle . Sharp Labs
Don Wright - Lexmark
Lloyd Young - Lexmark
Atsushi Yuki - Kyocera
Steve Zilles - Adobe

Authors' Addresses

Ron Bergman (Chairman)
Hitachi Koki Imaging Solutions
1757 Tapo Canyon Road
Simi Valley, CA 93063-3394
Phone: (805) 578-4421
Email: rbergma@hitachi-hkis.com

Gary Gocek (Editor)
15 Red Post Crescent
Fairport, NY 14450
(716) 223-3826
Email: gary@gocek.org

Harry Lewis (Editor)
IBM
6300 Diagonal Hwy.
Boulder, CO 80301
Phone (303) 924-5337
Email: harryl@us.ibm.com

Ira McDonald
High North Inc
Phone: +1 906-494-2434 or +1 906-494-2697
Email: imcdonald@sharplabs.com

Randy Turner
2Wire, Inc.
1704 Automation Parkway
San Jose, CA 95131
Phone (408) 895-1216
Email: rturner@2wire.com

Significant contributors

Joel Gyllenskog
Microworks, Inc.
Phone: (208) 375-1234
Email: joelgyllen@aol.com

Thomas N. Hastings
Xerox Corporation
Phone: (310) 333-6413
Email: hastings@cp10.es.xerox.com

Scott Isaacson
Novell
Phone: (801) 861-7366
Email: sisaacson@novell.com

Binnur Al-Kazily
Hewlett-Packard, Inc.
Phone: (208) 396-6372
Email: binnur_al-kazily@hp.com

David Kellerman
Northlake Software
Phone: (503) 228-3383
Email: kellerman@nls.com

Matt King
Lexmark International
Phone: (859) 232-6907
Email: emking@lexmark.com

Jay Martin
Underscore, Inc.
Phone: (603) 889-7000
Email: jkm@underscore.com

Mike McKay
Novell, Inc.

Bob Pentecost
Hewlett-Packard
Phone: (208) 396-3312
Email: bpenteco@boi.hp.com

Stuart Rowley
Kyocera
Phone: (510) 299-7206
Email: stuart.rowley@kyocera.com

Ronald L. Smith
Texas Instruments
Phone: (817) 774-6151
Email: rlsmith@nb.ppd.ti.com

Gail Songer
Peerless Systems Networking
Phone: (650) 569-4414
Email: gsonger@peerless.com

William Wagner
